

SEVEN-G + SPAD

Internal Methodology Guide

How to adopt, execute, and govern AI-assisted engineering at Seachad

1. Why this methodology exists

SEVEN-G and its core skill SPAD were created to address a recurring failure pattern in modern software and AI development: decisions are made implicitly, reasoning is mixed with execution, and systems become fragile as complexity grows. This methodology enforces structured thinking, mandatory audits, and controlled execution.

2. What SEVEN-G and SPAD are

SEVEN-G is an engineering framework built around skills. SPAD (Structured Prompt-Driven Engineering) is its foundational skill. All other capabilities depend on SPAD outputs.

3. Official execution order

- 1 01 Prompt Pack — defines how each phase is executed
- 2 02 Agent-Ready I/O — enables automation and agents
- 3 03 Skills Map — explains skill dependencies
- 4 04 Corporate Methodology — formal governance reference
- 5 05 Derived Skills — Agent Design, Risk, FinOps AI
- 6 06 Web / Landing — communication and positioning
- 7 11 SPAD-Compliant™ Certification — quality gate

4. How SPAD is used in practice

SPAD is executed in blocking phases. Each phase must complete and be validated before the next one starts. AI roles are separated to avoid conflicts of reasoning.

- Context → PLAN → AUDIT_PLAN → CODE_PRIMER → IMPLEMENTATION → AUDIT_CODE → FIX_PRIMERS

5. How to implement this methodology internally

To adopt SEVEN-G + SPAD internally, teams must be trained on phase discipline, artifact creation, and audit independence. Projects should only be declared complete once SPAD-Compliant™ certification is achieved.

6. Governance and certification

The SPAD-Compliant™ certification acts as the final quality gate. It ensures consistency, traceability, and defensible engineering decisions across the organization.

7. Final note

This methodology is not designed to slow teams down. It is designed to prevent costly mistakes, enable safe AI usage, and scale engineering quality as complexity increases.
