

SEVEN-G + SPAD

Developer Workflow Guide

How to implement a new feature using Antigravity under the SPAD methodology

1. When this guide applies

This guide applies when a developer is asked to implement a new feature, change existing functionality, or introduce new logic in a system governed by the SEVEN-G framework and SPAD methodology.

2. The core rule you must follow

You are not asked to start coding. You are asked to execute the SPAD workflow.

3. Step-by-step workflow (Antigravity example)

- 1 Receive the feature request and clarify scope, constraints, and success criteria.
- 2 Activate SPAD explicitly for the task.
- 3 Use Antigravity to generate the PLAN prompt and obtain the architectural design.
- 4 Wait for the PLAN output. Do not write code.
- 5 Run the AUDIT_PLAN prompt (Antigravity or separate IA).
- 6 If the verdict is not GO, iterate on the PLAN.
- 7 Once GO is obtained, generate the CODE_PRIMER.
- 8 Only after CODE_PRIMER is approved, use Antigravity to generate code.
- 9 Submit the generated code to AUDIT_CODE.
- 10 If issues are found, apply FIX_PRIMERS only.
- 11 Stop when AUDIT_CODE returns OK.

4. What you must NOT do

- Do not jump directly to coding.
- Do not mix PLAN and IMPLEMENTATION.
- Do not bypass audits.
- Do not introduce new design decisions while coding.
- Do not fix issues without FIX_PRIMERS.

5. What evidence you must produce

Your work is complete only when all SPAD artifacts exist and the feature can be considered SPAD-Compliant™.

- Context definition
- PLAN document
- AUDIT_PLAN report

- CODE_PRIMER
- Implementation
- AUDIT_CODE report
- FIX_PRIMERS (if needed)

6. Final note to developers

SPAD is not bureaucracy. It is protection. If you follow this workflow, you will make fewer mistakes, receive clearer feedback, and deliver more robust systems.
