

Notes

This presentation develops the Board and management action area of SEVEN-G. The question it answers is direct: what the board must see about AI and which questions it must ask.

The area fits into three sentences. The board approves the AI thesis and the risk appetite, approves the transformation bets and oversees results. To do so it needs to see the whole portfolio, the validated value and the risks, not demonstrations. Its decisions and recommendations are recorded and followed up.

The cover image is the portfolio funnel. SEVEN-G treats the set of AI initiatives as a sales funnel: each initiative comes in as a proposal and goes through mandatory stages (value hypothesis, proof of concept, development and use). The funnel shows how many are in each stage, which ones left and why, and which ones are in use. It is the first view a board needs: not one brilliant case, but the whole.

The ten slides:

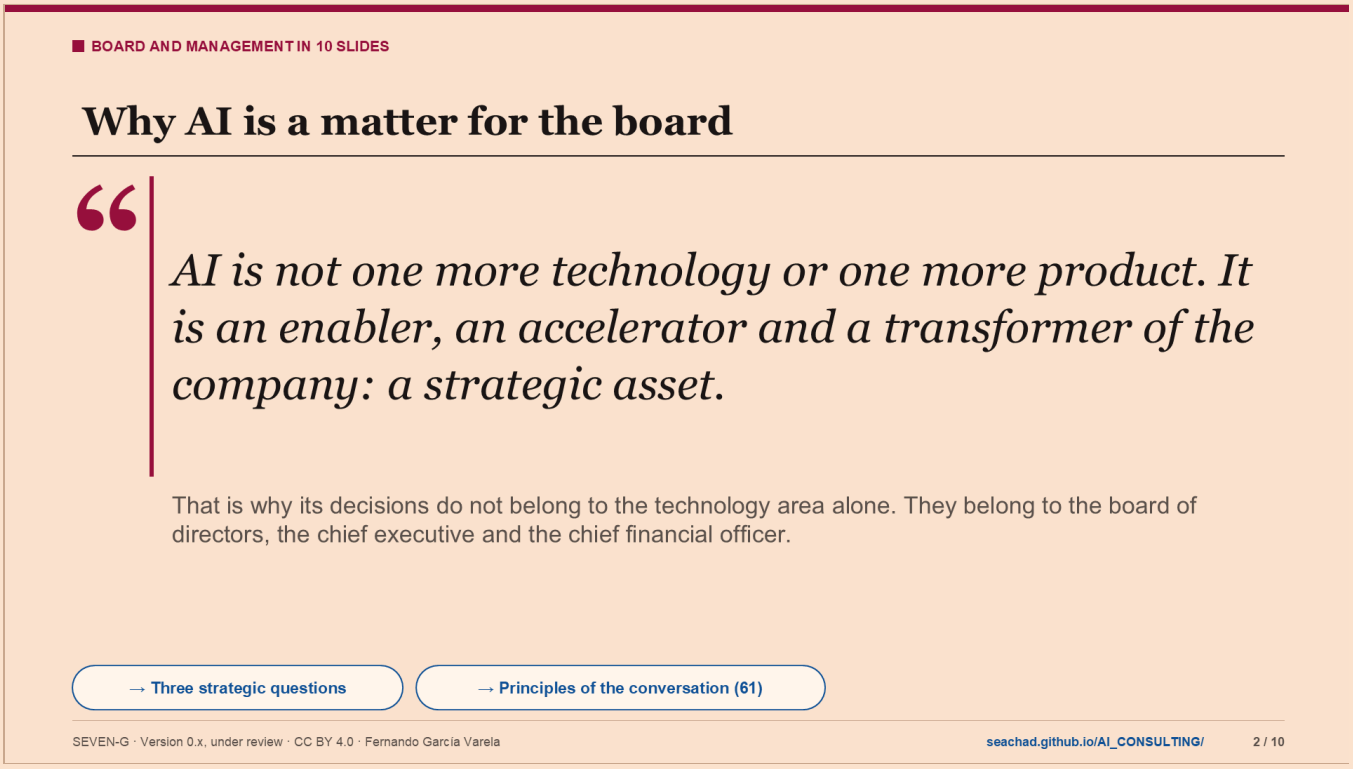

- Why AI is a matter for the board.
- The key concepts of the glossary (document 02).
- What the board decides in the corporate cycle.
- What it receives every quarter and with which rules.
- The board dashboard: how to read it and what holds back scaling.
- Where the impact is and the three perspectives of each case.
- The board's questions and the difficult questions.
- Frequent mistakes.
- The relationship with other areas and with SPHERES, and how to start.

Everything said here comes from SEVEN-G documents 60 (board pack), 61 (board conversation guide) and 62 (recommendations and decisions register), and from SPHERES document 05. The figures in the images are fictitious.

Question for the classroom: if tomorrow your company's board asked to see all the AI in use on a single page, who could prepare it and with what data?

Notes

This is the idea that holds the whole area together. If AI were just another tool, the technology area could manage it alone. But AI changes how customers are served, which products are offered, how people work and which decisions are delegated to a system. It affects the value, the risk and the accountability of the company. That is why SEVEN-G treats it as a strategic asset.

A board of directors does not think in “AI use cases”. It thinks in risk, opportunity, accountability and competitive advantage. The conversation guide (document 61) sets seven principles for talking to it:

- The board decides on business, not on technology.
- The answer comes first, then the reason and the evidence.
- Every figure has a status: validated, declared or estimated.
- Few use cases, well told: three in detail at most.
- Say what is not working: stops, retirements and incidents, with the same clarity as successes.
- Every board question ends up in the register.
- Nobody marks their own exam: whoever presents an initiative does not assess its compliance.

What changes for management. The chief executive answers to the board for the AI strategy. The chief financial officer makes sure that value and cost figures withstand an audit. The technology area builds and operates, but it does not decide alone where to play or how much risk to accept.

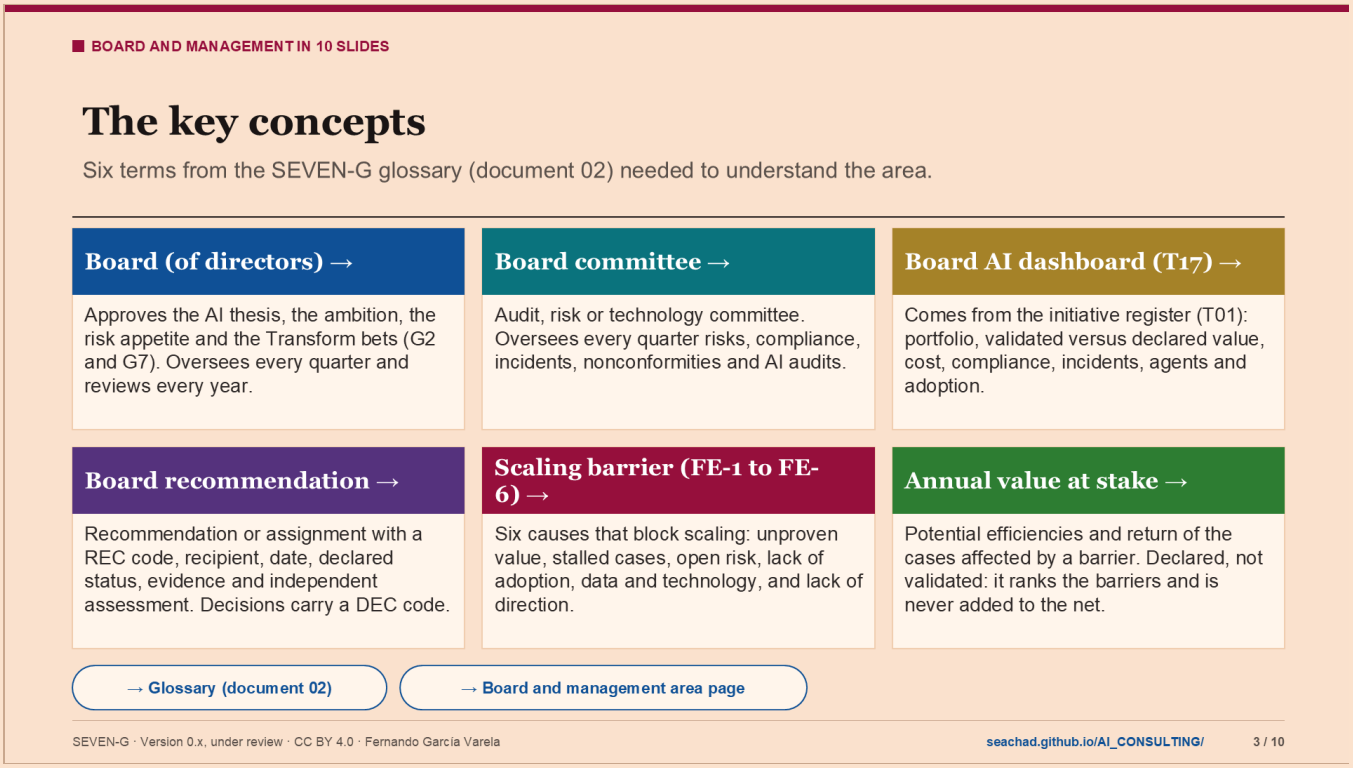

Why it matters. Many board sessions on AI end with interest and no decision. Without a framework, AI returns to the agenda six months later at the same point.

Question for the classroom: in your organisation, who presents AI to the board today? Do they talk about models and platforms, or about value, risk and accountability?

Notes

Six concepts are enough to follow the rest of the presentation. All of them are in the SEVEN-G glossary (document 02) and on the area page.

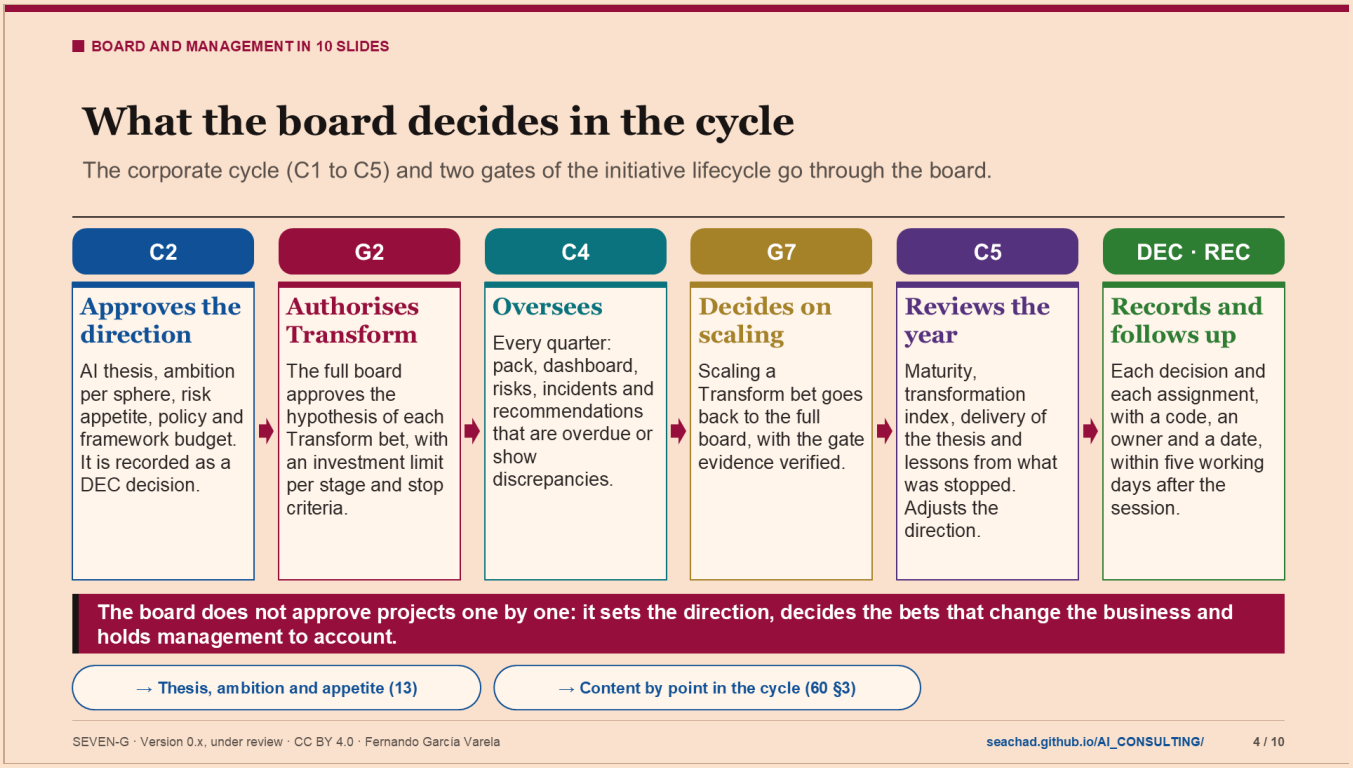

- Board of directors. It is the body that approves the AI thesis, the ambition, the risk appetite and Transform initiatives, at the hypothesis gate (G2) and when scaling (G7). It oversees every quarter and reviews progress every year. It may act through its board committee.
- Board committee. It is a committee of the board: audit, risk or technology. It oversees, every quarter, risks, regulatory compliance, incidents, major and critical nonconformities and AI audits. What goes to the full board and what to the committee depends on the articles of association and the board regulations; if there is no committee with those powers, everything goes to the full board.
- Board AI dashboard. It is the oversight tool (T17). It is fed by the initiative register (T01): a single source of data and the same cut-off date for the pack, the dashboard and the recommendations register. Nobody redoes figures by hand.
- Board recommendation. What the board recommends or assigns receives a REC-AAAA-NNN code that is never reset or reused. Board decisions receive a DEC-AAAA-NNN code. In this way, follow-up does not depend on memory or on the minutes.
- Scaling barrier. Many companies have cases that work and still cannot scale them. The dashboard ranks six barriers, from FE-1 to FE-6, and says what each one blocks, what to do and who does it.
- Annual value at stake. It is the sum of the potential efficiencies and return of the cases a barrier touches. It is used to rank, not to promise: it is declared value, never validated, and it is not added to the portfolio net value.

Why it matters. With these six terms, the board knows who decides, where it looks and how it holds to account. Without them, each session invents its own vocabulary and nothing can be compared over time.

Question for the classroom: does your board have a committee that oversees AI? If not, who sees the incidents today?

Notes

SEVEN-G has two levels. The corporate cycle (C1 to C5) governs AI across the whole company. The initiative lifecycle (phases 0 to 7, with their gates) governs each case. The board steps in at fixed points of both.

- Direction (C2). Once a year, the board approves the AI thesis (why and what for the company uses AI, and what it will not do), the target ambition per sphere, the risk appetite, the thresholds (for example, the investment above which an initiative is Enterprise), the red lines and the framework budget (document 13). What it approves here becomes criteria that the portfolio and each gate apply.
- Hypothesis gate (G2). A Transform initiative changes the value proposition, creates revenue that did not exist or changes the business model. That is why the full board approves it, with an investment limit per stage and stop criteria set before investing.
- Oversight (C4). Every quarter the board receives the quarterly pack. It answers a single question: is what was decided being delivered, and what does the board have to decide now?
- Scale or retire (G7). Scaling a Transform bet goes back to the full board. Without verified evidence, the decision is not requested.
- Review (C5). Every year the board assesses maturity, the transformation index and whether the thesis has been delivered. It asks whether the company is transforming or only becoming more efficient, and adjusts the direction for the next cycle.
- Register. Each decision receives a DEC code and each assignment a REC code, with an owner and a date, within five working days after the session (document 62).

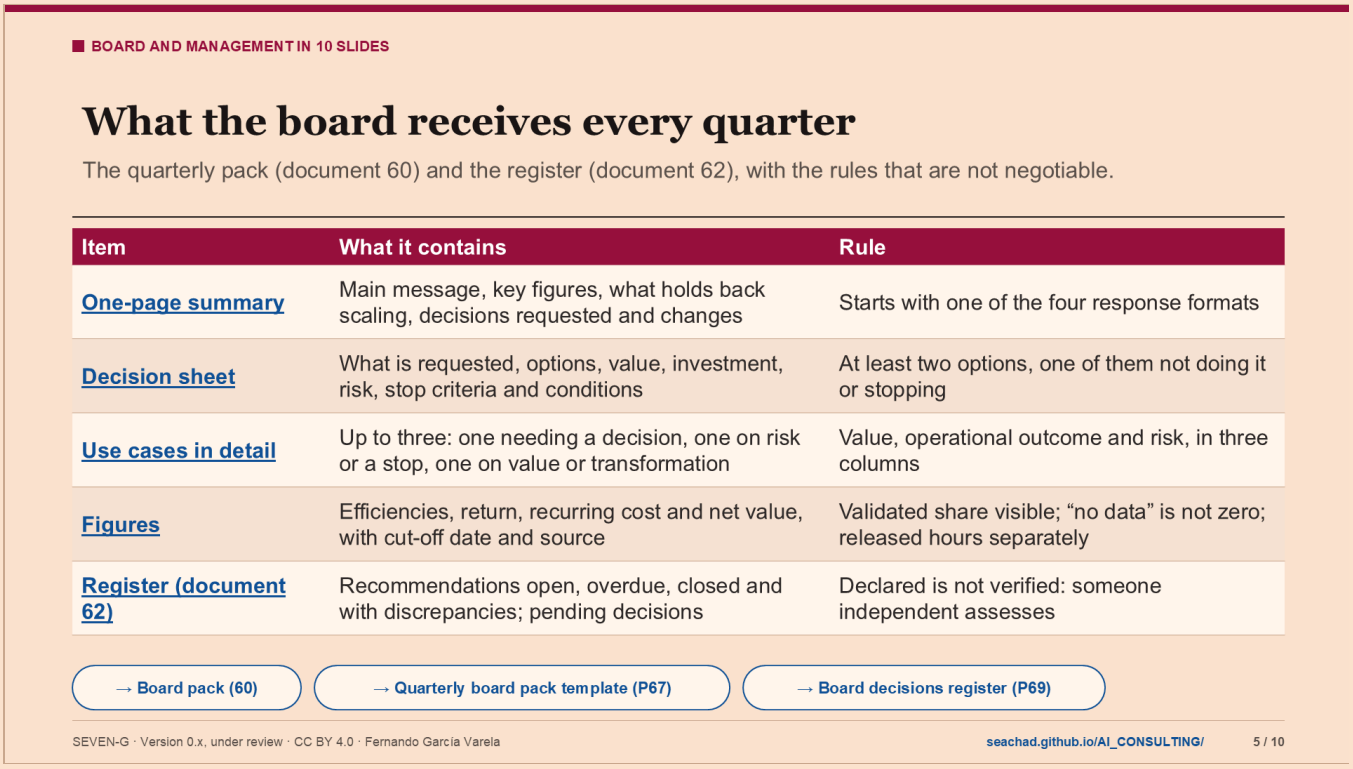

The board also decides the exceptional acceptance of a Critical residual risk, always with a time limit. The other Enterprise gates are decided by the AI Committee.

Why it matters. If the board only sees AI when there is an incident, it governs too late. With fixed points, AI enters the agenda like any other investment and risk decision.

Question for the classroom: what should your company never do with AI? Has anyone written it down?

BOARD AND MANAGEMENT IN 10 SLIDES

What the board receives every quarter

The quarterly pack (document 60) and the register (document 62), with the rules that are not negotiable.

Item	What it contains	Rule
One-page summary	Main message, key figures, what holds back scaling, decisions requested and changes	Starts with one of the four response formats
Decision sheet	What is requested, options, value, investment, risk, stop criteria and conditions	At least two options, one of them not doing it or stopping
Use cases in detail	Up to three: one needing a decision, one on risk or a stop, one on value or transformation	Value, operational outcome and risk, in three columns
Figures	Efficiencies, return, recurring cost and net value, with cut-off date and source	Validated share visible; "no data" is not zero; released hours separately
Register (document 62)	Recommendations open, overdue, closed and with discrepancies; pending decisions	Declared is not verified: someone independent assesses

→ Board pack (60) → Quarterly board pack template (P67) → Board decisions register (P69)

SEVEN-G · Version 0.x, under review · CC BY 4.0 · Fernando García Varela seachad.github.io/AI_CONSULTING/ 5 / 10

Notes

The quarterly pack has eight sections: one-page summary, decisions requested, programme traffic light, dashboard, risks, incidents and nonconformities, recommendations and commitments, and use cases in detail. Annexes are not presented in the session. The table shows the items that most change the quality of the decision.

- One-page summary. It starts with what the board has to decide. It answers "is what was decided being delivered?" with one of the four response formats. It includes the three barriers to start with.
- Decision sheet. Each decision is written so that it can be approved or rejected exactly as it stands. It has at least two options, one of them not doing it or stopping, and the stop criteria set before deciding. If the evidence is not verified twelve working days before the session, that decision is not requested.
- Use cases in detail. Three per session at most. A balanced combination: one that needs a decision, one on risk, an incident or a stop, and one on value or transformation. Economic value, operational outcome and risk exposure go in three parallel columns.
- Figures. The presentation rules are strict. Every total carries the validated share. A missing figure is shown as "no data", not as zero. Released capacity is not added to the net until it is realised. Cases with a negative net value are listed; they are not offset in aggregates. Nothing is compared with "the market" without a verifiable source.
- Register. The board sees overdue recommendations and the discrepancies between what the recipient declares and what an independent person assesses.

The underlying rule is that the pack is prepared by those who do not decide: the AI office prepares, management control validates the figures, the AI Committee reviews and the board decides. Nobody validates their own work.

Why it matters. A long pack without decisions turns the session into a presentation. A short one, with figures that carry a status, allows decisions to be made in the session.

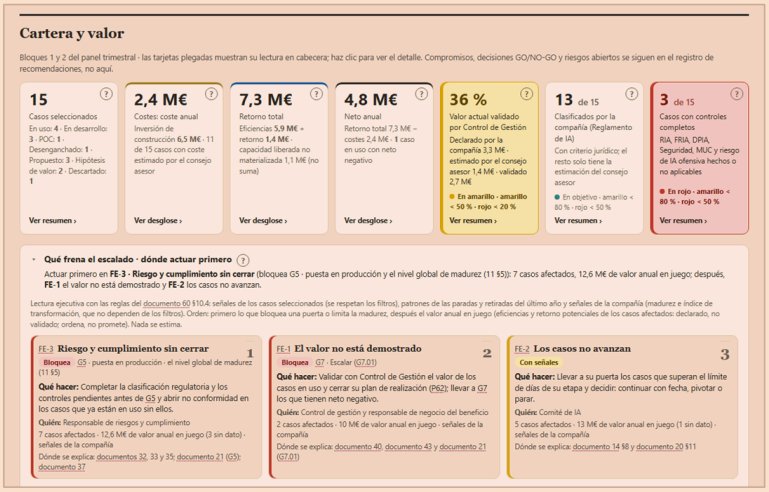

Question for the classroom: how many pages on AI did the last board you know receive? How many of them ended in a decision?

■ BOARD AND MANAGEMENT IN 10 SLIDES

The dashboard: how to read it and what holds back scaling

- **Figures** Each total carries its share validated by management control. The headline figures can be clicked to open their cases.
- **Barriers** Six barriers ranked: first what blocks a gate, then the annual value at stake. The top three are “act first on”.
- **Use** “Current” view by default, compared with the snapshot of the previous session. Potential only with investment, hypothesis and time.
- Screenshot in Spanish, from the example dashboard with fictitious data.

→ Example board dashboard | → Mobile version of the dashboard | → How the dashboard is generated (T17)

SEVEN-G · Version 0.x, under review · CC BY 4.0 · Fernando García Varela seachad.github.io/AI_CONSULTING/ 6 / 10

Notes

The screenshot is the top of the example dashboard, in the “Portfolio and value” block. All figures are fictitious, and the screenshot is in Spanish.

How to read it. The top row gives the key figures: selected cases, annual cost, total return, annual net value, the share of value validated by management control, the cases classified under the EU AI Act and the cases with all their controls complete. Colours mark thresholds: in the example, only part of the value is validated and the box appears in amber. Each figure can be clicked and opens the summary or breakdown of its cases.

What holds back scaling. Below is the executive reading of document 60 §10.4. It answers a question many companies ask: what is stopping us from scaling AI today? It ranks six barriers:

- FE-1 Value is not proven.
- FE-2 Cases do not move forward.
- FE-3 Risk and compliance not closed.
- FE-4 People do not adopt it.
- FE-5 Data and technology are not ready.
- FE-6 Lack of direction and governance.

The order follows fixed rules. First come the barriers that block a gate (go-live, G5, or scaling at G7) or that limit the overall maturity level. Then the annual value at stake; then the cases affected. Each card says what to do, who does it and where it is explained. The reading ranks; the body decides and records the action.

How it is used. The board member reads the mobile version before the session. In the session, the full version is projected. The default view is “Current”, and it is compared with a saved snapshot of the previous session, so that changes are not read on data that has moved since the pack was sent.

Why it matters. A dashboard that only informs leaves the decision unprepared. Ranking the barriers with written rules turns twenty indicators into a defensible priority for action.

Question for the classroom: in the example, why does the risk barrier come before the value barrier, even though it affects fewer cases?

BOARD AND MANAGEMENT IN 10 SLIDES

Where the impact is and the three perspectives

- **Map** Spheres 01 to 07 in rows (01–04 value, 05–07 enablers) and Optimise, Augment and Transform in columns.
- **Gaps** The target ambition of each sphere comes from the thesis approved at C2. The map marks gap, outside the thesis and no evidence.
- **Three perspectives** In the case sheet, economic value, operational outcome and risk exposure go side by side. They are never merged.
- Screenshot in Spanish, fictitious data. Spheres 08 (boundaries) and 09 (governance meta-sphere) are assessed separately.

→ Portfolio heat map (10 §8)

→ Value measurement rules (40)

SEVEN-G · Version 0.x, under review · CC BY 4.0 · Fernando García Varela seachad.github.io/AI_CONSULTING/ 7 / 10

Notes

The screenshot is the “Where the impact is” card of the example dashboard. It applies the portfolio heat map (tool T16) with the rules of document 10 §8. All figures are fictitious, and the screenshot is in Spanish.

How to read the map. SEVEN-G organises the impact of AI into nine spheres. Spheres 01 to 04 are where value is created (customer, product and service, people and operations). Spheres 05 to 07 are enablers (data, knowledge and decision). Sphere 08 marks the boundaries (regulation, ethics and accountability) and 09 is the AI governance meta-sphere. On the map, spheres 01 to 07 are in rows and the three ambition levels in columns. Each cell shows how many initiatives there are (and how many in use), the investment and recurring cost, the annual net value and the validated value. Clicking a cell shows its initiatives. A selector changes the rows to business units. Spheres 08 and 09 are not deduced from the map: they are assessed with their own grades.

The gaps. The target ambition of each sphere is the one the board approved at C2. The dashboard takes it from the thesis stored in the initiative register (T01). If a sphere has a Transform target and no case delivers it, the map marks a “gap”. It also marks what is outside the thesis and what has been in use for more than twelve months without validated value.

The three perspectives. Each case is presented in three columns read together: economic value in euros with its status, operational outcome with its physical indicators (baseline, target and current value) and risk exposure. None is translated into another, and they are not combined into a score (document 40, presentation rule 11).

Why it matters. The board needs to see at a glance where the company plays with AI and where it does not. It is the view of the annual direction pack (C2) and review pack (C5).

Question for the classroom: if all your company’s investment were in Optimise operations, would that be a problem? What does it depend on?

Notes

The six cards are the board's questions that the SEVEN-G entry page answers, each on its own page with the answer in three ideas and where to see it in practice. Click each card to open it.

How to answer. Every yes-or-no question, and every proposed decision, is answered with one of four formats (document 61 §4):

- "Yes", with the main evidence in one sentence.
- "Yes, with one condition: …", with its owner and its deadline. A single condition; if there are several, the real answer is "not yet". The condition never affects critical controls for security, legal compliance or human oversight.
- "Not yet, because … is missing", with who provides it and when it will be brought back. It creates a recorded commitment.
- "No, because …", with the reason and the alternative. Avoiding a bad investment also creates value.

"It depends" is not an answer.

The difficult questions. Document 61 §9 lists seventeen frequent difficult questions, with how to answer, the evidence that supports the answer and what to avoid. Some of them:

- How much does AI save us? Separate efficiencies, return and recurring cost, give the net value and the validated share, and released capacity separately.
- Are we behind the competition? If there is no verifiable source, say so, and compare the company with itself over time.
- Why have we stopped this after investing? Because the stop criterion set before investing was not met.
- What is stopping us from scaling AI? Name the three barriers to start with, without presenting the value at stake as secured.

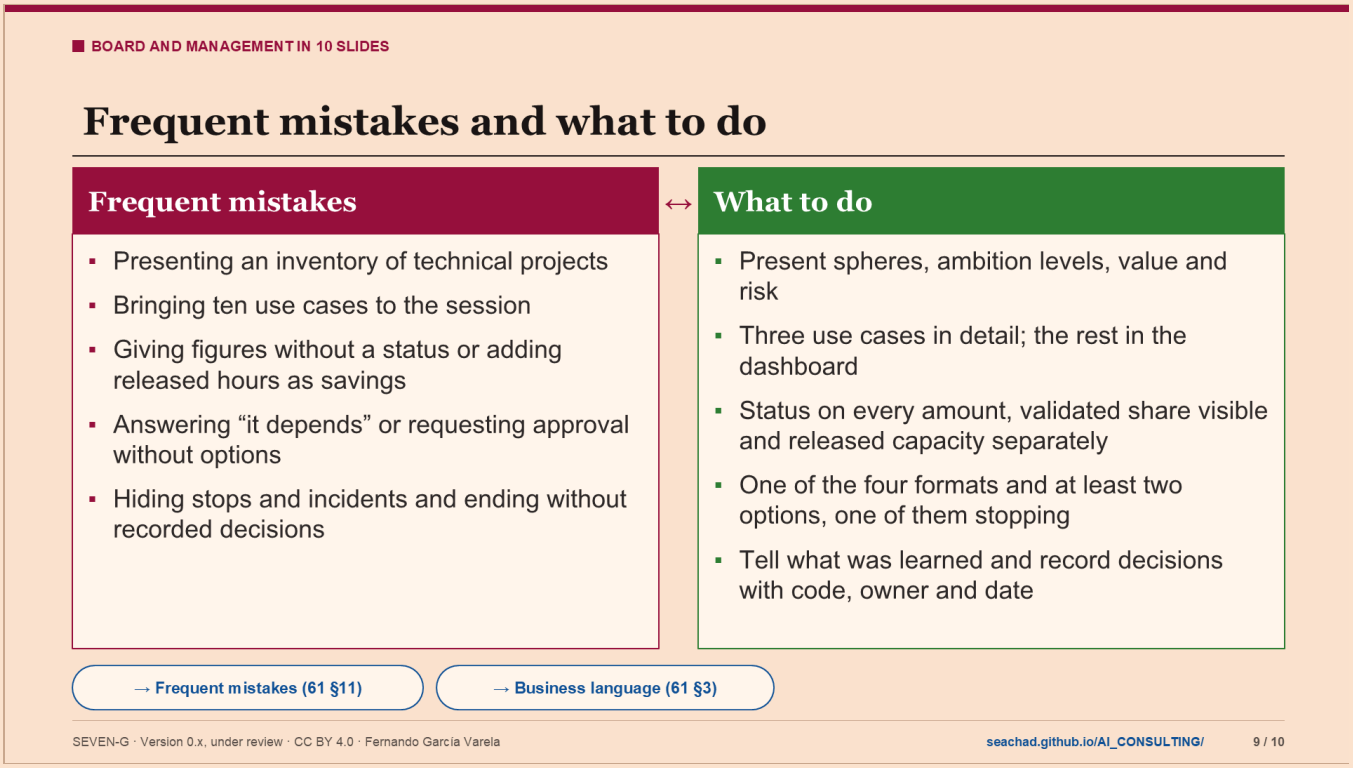

- How do we know it is worth it if it cannot be put in euros? Separate the three perspectives and say when it will be reviewed again.

Why it matters. A board question without a clear answer becomes a postponed decision. If it cannot be answered in the session, it is recorded as a recommendation or assignment with an owner and a date.

Question for the classroom: choose one of the six questions and answer it for a company you know, using one of the four formats.

Notes

Document 61 §11 lists twelve frequent mistakes when talking about AI with a board, with their consequence and what to do. The slide groups the most common ones.

- An inventory of technical projects does not allow the board to prioritise or hold to account. What it needs is to see spheres, ambition levels, value and risk.
- With ten use cases nothing is decided and the session drags on. Three use cases in detail allow the board to understand, ask and decide.
- A figure without a status leads to decisions about value that does not exist. Adding released hours as savings inflates a value that does not appear in the income statement.
- “It depends” leaves the board not knowing what to decide. A request without options prevents it from performing its function: there must be at least two, one of them not doing it or stopping.
- Hiding stops and incidents causes a loss of trust when they become known. A session without recorded decisions leaves what was discussed in the memory of those present.

Other mistakes on the list: calling any initiative transformation, having whoever presents an initiative assess its compliance, comparing with the market without a source, and talking about models instead of decisions.

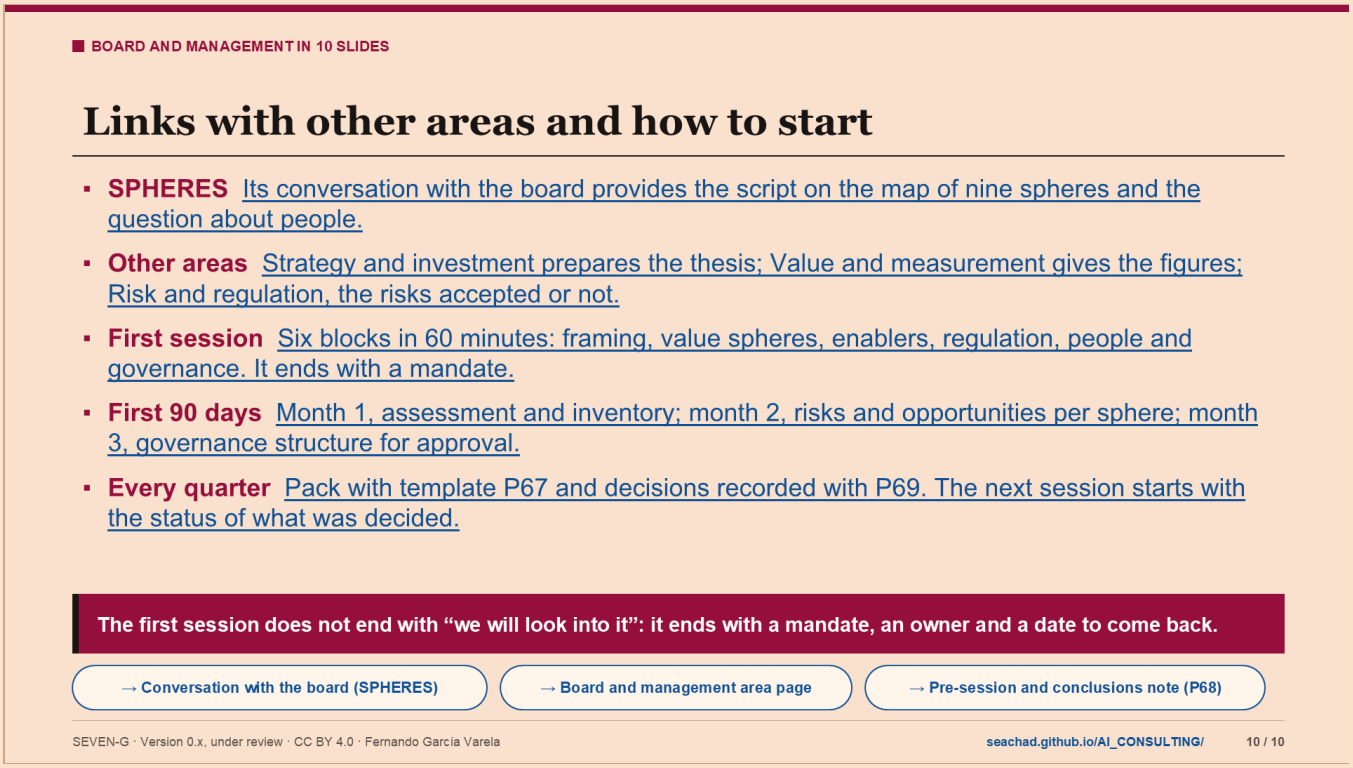

A good remedy for the last one is the business language table in document 61 §3.2. For example, instead of “we have saved 20,000 hours”, say “we have released 20,000 hours; of these, 6,000 have been reassigned and none has yet reduced cost” (fictitious figures). Instead of “we comply with the AI Act”, give the status by system: how many are inventoried, how many are classified on legal criteria and how many impact assessments are done.

Why it matters. These mistakes are not about form. Each one changes what the board decides, or makes it decide nothing.

Question for the classroom: which of these mistakes have you seen most in a presentation on AI? Which decision was lost because of it?

Notes

This area does not work alone. It relies on other areas and on SPHERES.

SPHERES. It is the explanatory layer of the nine spheres and the three ambition levels (Optimise, Augment and Transform). Its document 05, "Conversation with the board", translates AI into risk, opportunity, accountability and competitive advantage. It proposes building, before the session, a preliminary map with the known initiatives, each one in its sphere and level, and marking what is not known. The gaps on the map are often the first relevant finding. SEVEN-G provides the rules, the dashboard and the register.

Other areas. Strategy and investment prepares the thesis and the budget that the board approves at C2. Value and measurement gives the rules for the figures. Risk and regulation defines the risks the board accepts or not. Maturity and transformation provides the assessment and the index that the board reviews at C5.

How to start. The conversation guide (document 61 §8) proposes a first 60-minute session in six blocks:

- Strategic framing: why AI is a business issue.
- Spheres where value is created: where the company's AI is today.
- Enabler spheres: real capability in data, knowledge and decision.
- Regulation, ethics and accountability: whether governance is proactive.
- Position on people: will AI replace, augment or reorganise work?
- Governance and first 90 days: the board decides whether to commission the assessment and the governance structure.

The ninety-day plan: month 1, maturity assessment with evidence and inventory; month 2, risks and opportunities per sphere with an owner and a deadline; month 3, governance structure with bodies, roles, thresholds, gates, metrics and reporting rhythm. Then the quarterly pack (template P67) and the decisions register (P69).

The board may rely on a director or adviser with AI experience. This person helps it ask good questions, interpret the evidence and follow up decisions, but does not manage the company's AI. The EU AI Act includes AI literacy obligations (Article 4); their scope for the board must be assessed on legal criteria.

Question for the classroom: what position would your board take on people: replace, augment or reorganise?
