

Notes

This presentation answers a very practical question for any management team: where artificial intelligence use cases come from, how they enter the company and what your sector does.

A use case is the specific application of an AI system to a process or a decision. For example, an assistant that reads customer complaints, classifies them and proposes a reply that a case handler reviews before sending it. An initiative may include several use cases.

The central idea of the area fits in three sentences. First: a use case enters through a single door, with a minimum entry record and a business sponsor. Second: from then on it is an initiative in the register and moves through the portfolio funnel, phase by phase and gate by gate. Third: what does not come through the door is the largest risk: AI included in products the company already has under contract, unauthorised use and free proofs of concept.

Why it matters: without a single door, the company does not know how much AI it uses, who is accountable for each system or how much real value it brings. With one, every proposal has an owner, a reason for entering or being discarded and a trail that the board can review.

The ten slides follow this order: why it matters, the key concepts, how SEVEN-G handles it, the tools and templates, an example with fictitious data, common errors, questions for management or the classroom, the relationship with other areas and with SPHERES and SPAD, and how to start.

Question to open the session: does your company know how many AI systems it uses today and where each one came from?

Notes

Demand for AI does not arise in one place. SEVEN-G distinguishes eight sources. Each one brings something valuable and a typical bias, and each one usually lacks something specific before entering the portfolio.

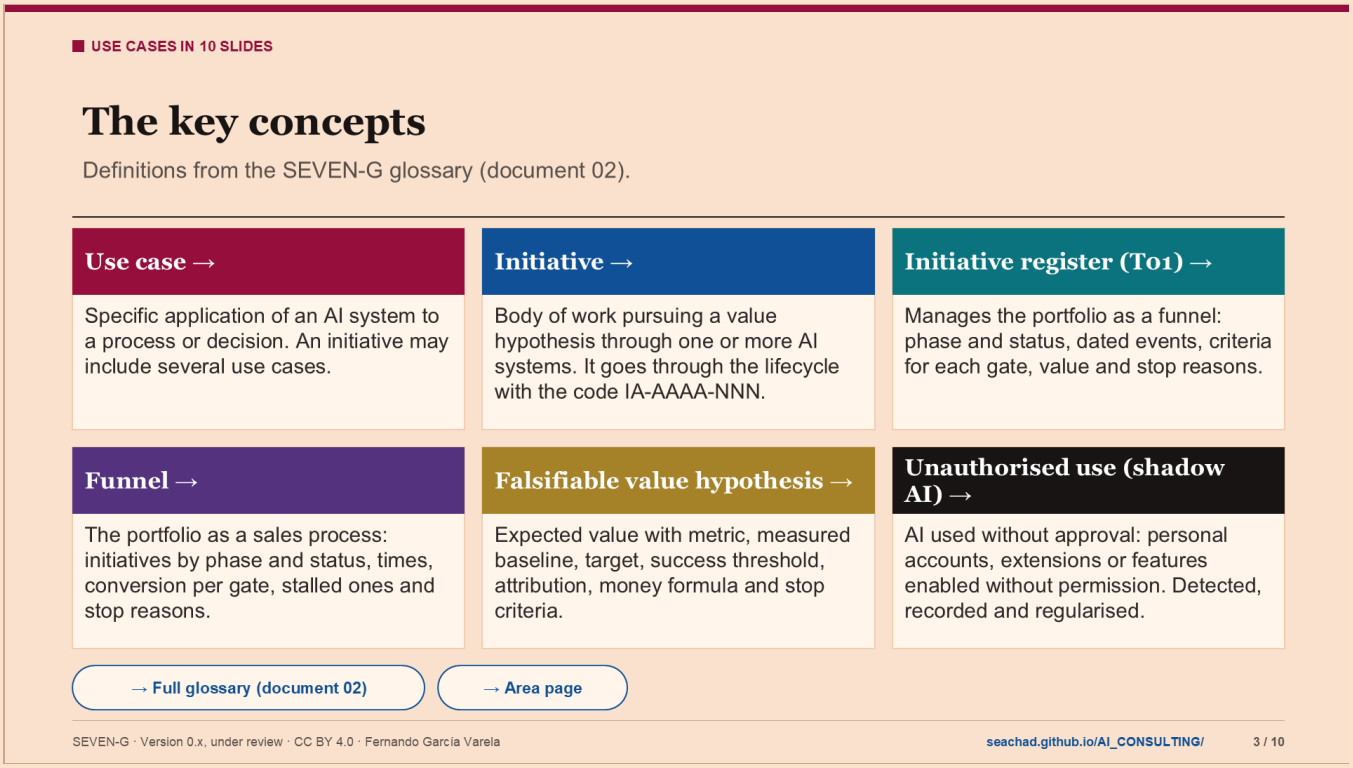

- Business units and operations: they bring real problems, with their own process and data. They usually lack a baseline and an attribution method (document 40).
- Technology and data: they bring new capabilities that are now possible and cheap. They lack a business sponsor who owns the benefit.
- The product market: AI features that appear inside software the company already uses. They lack inventory registration, regulatory classification and a conscious decision to enable them.
- Employees: individual use of general-purpose tools; the best small cases come from here. They lack a proposal channel, an acceptable use policy and AI literacy (document 31).
- Customers and channel: explicit requests and observed friction. They lack segment size and willingness to pay.
- Regulation, audit and incidents: obligations and findings that require change. They lack fit with the portfolio.
- Board and senior management: ambition challenges and sector comparisons. They need to be translated into a falsifiable hypothesis and into a sphere and an ambition level (document 10).
- Innovation ecosystem: suppliers, start-ups, venture capital and universities. They lack an internal sponsor, data that can be shared and an exit plan (document 36).

Why it matters: if the company knows the bias of each source, it asks in time for what is missing and does not mistake enthusiasm for value. And three of these routes (AI included in contracted products, unauthorised use and the free proof of concept) usually come in without passing through the door. That is where most of the risk lies.

Question for the classroom: which of these eight sources do your company's initiatives come from? Is there one that never appears?

Notes

Six concepts are enough to understand the area.

- Use case: the specific application of an AI system to a process or decision. It is what a business person understands. It is described with the use case sheet (P31), in plain language: a board member with no technical training must be able to explain it after reading it.
- Initiative: the body of work pursuing a value hypothesis through one or more AI systems. It is the unit that SEVEN-G governs: it has a code, a sponsor, a phase, gates and value.
- Initiative register (T01): the central tool. It works like a CRM for AI: each initiative has phase and status, dated events, criteria for each gate, conditions, tags, value and stop reasons.
- Funnel: the way of seeing the portfolio as a sales process. It shows how many initiatives are in each phase, how long they take, how many pass each gate, which are stalled and why each one was stopped.
- Falsifiable value hypothesis: the expected value written so that it can fail. It has a main metric, a measured baseline, a target, a success threshold, an attribution method, a monetary value with a formula and stop criteria. A hypothesis that cannot fail is not valid.
- Unauthorised use (shadow AI): AI tools used without approval. It is detected, recorded and regularised (authorisation, replacement or blocking) as a nonconformity; it is at least major if it involves personal or confidential data.

Why it matters: these concepts separate the idea (use case) from the unit that is governed and funded (initiative). The board then sees an ordered, comparable portfolio, not a list of projects with declared value.

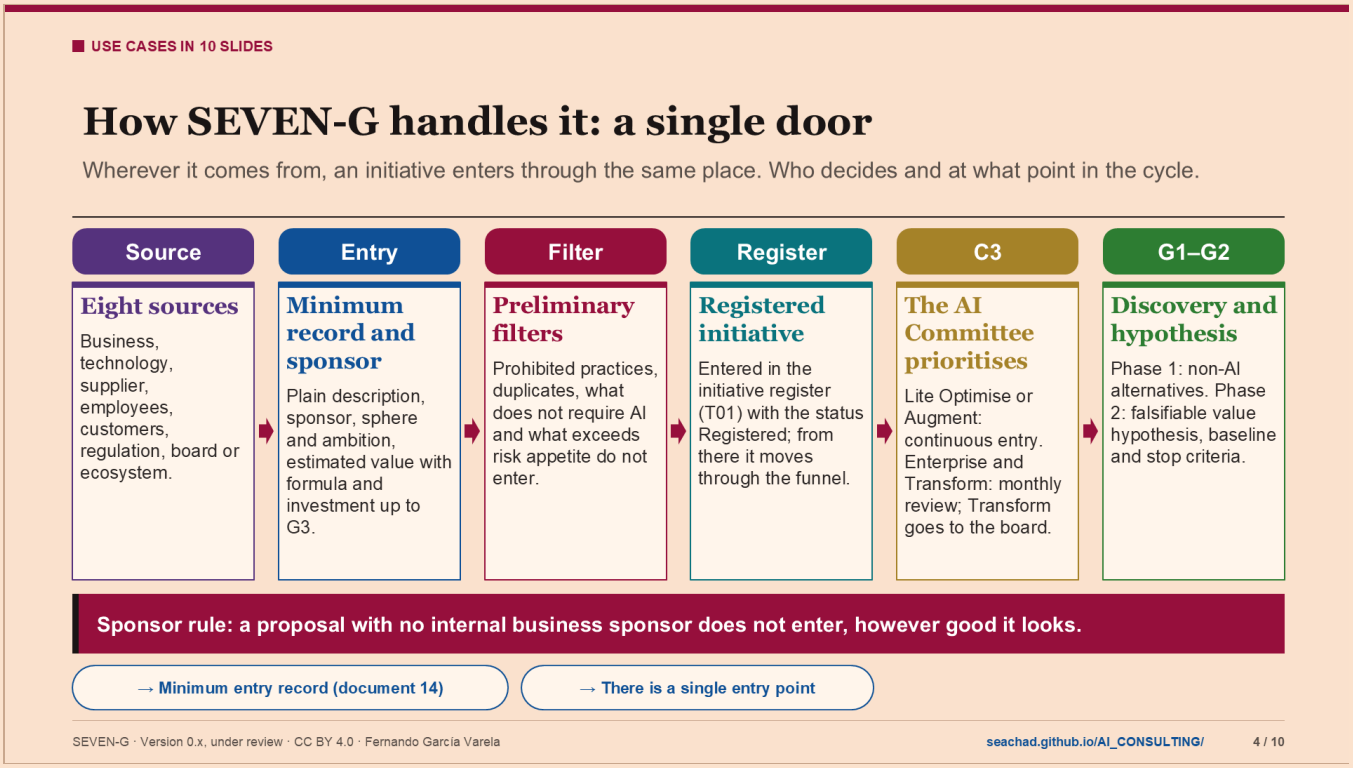

Question for the classroom: think of a use of AI in your work. Is it a use case inside a registered initiative, or unauthorised use?

Notes

Wherever it comes from, an initiative enters through the same place. SEVEN-G solves this with three pieces from document 14: the minimum entry record, the preliminary filters and the entry windows.

The minimum entry record asks for seven fields: a plain-language description, with no jargon; the sponsor and the product owner, appointed and without incompatibilities; the proposed sphere and ambition level; the order of magnitude of the value, with a formula and marked as estimated; the investment up to the feasibility gate (G3); the fit with the AI thesis; and the foreseeable Enterprise criteria.

The preliminary filters leave out, and record with the reason: practices prohibited by regulation; initiatives that duplicate an existing one, which are merged; those that do not require AI, which are referred to the alternative; those outside the approved risk appetite; and Transform initiatives without senior management sponsorship.

Who decides and when. Entry and priority in the portfolio are decided by the AI Committee at its monthly review, within stage C3 of the corporate cycle. Optimise and Augment initiatives with Lite intensity enter continuously and the committee is made aware of them at its monthly meeting. Enterprise and Transform initiatives enter at the monthly review, with full prioritisation, and Transform initiatives are escalated to the board at its next quarterly session. The AI Office is the engine: it prepares the decisions and maintains the register.

Then the initiative goes through the lifecycle. In phase 1 (opportunity discovery) those that do not need AI are discarded. In phase 2 the falsifiable value hypothesis is formulated. Gate G3 is the main stop gate.

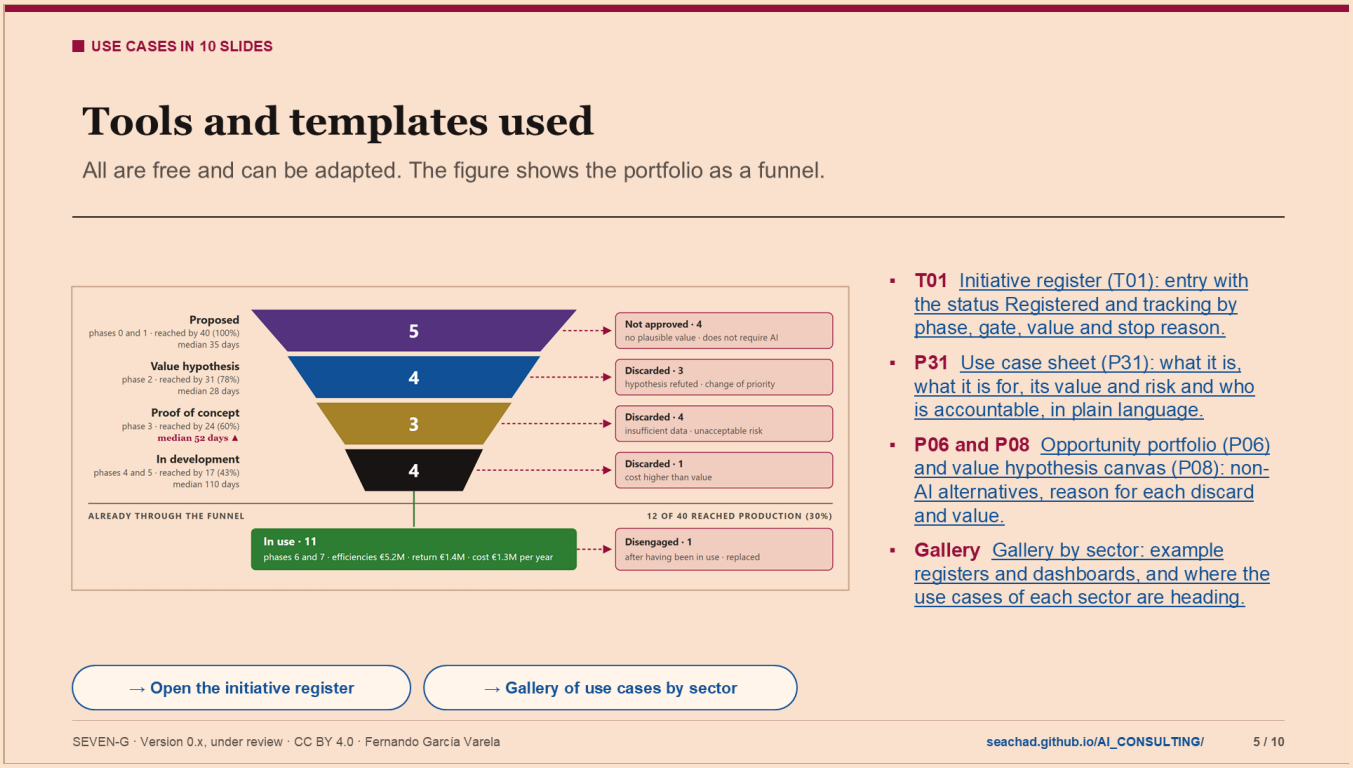

Why it matters: a “no” that is not recorded comes back three months later. With a single door, every proposal has an owner and a reason.

Notes

The area uses few tools, and all of them are free and adaptable.

- Initiative register (T01). It is the central tool. A proposal that passes the entry door is entered with the status Registered. From there the register tracks its phase, its gates, its value and, if it is stopped, the reason. The register also includes the intensity questionnaire (T04) and the sphere and ambition classifier (T05), which help to complete the minimum entry record.
- Use case sheet (P31). It explains in one or two pages what the case is, what it is used for, what value it brings, what risks it has and who is accountable for it. It is created in phase 1 and updated at the close of each phase. Clarity test: a board member with no technical training must be able to explain the case after reading it.
- Opportunity portfolio and screening notes (P06). It records the opportunities, the non-AI alternatives considered and the reason why each one proceeds, is held or is discarded.
- Value hypothesis canvas (P08). It formulates the expected value as a falsifiable, measurable hypothesis expressed in money, with its attribution method and stop criteria, before investing.
- Gallery of examples by sector. It shows registers and board dashboards of fictitious companies and, for several sectors, which use cases are being adopted and which are expected, with their sources. It is guidance for prioritising, not a recommendation for any specific company.

The figure shows the portfolio as a funnel: the stages in progress, the initiatives that did not pass each stage with their reason and, at the end, those in use and those disengaged.

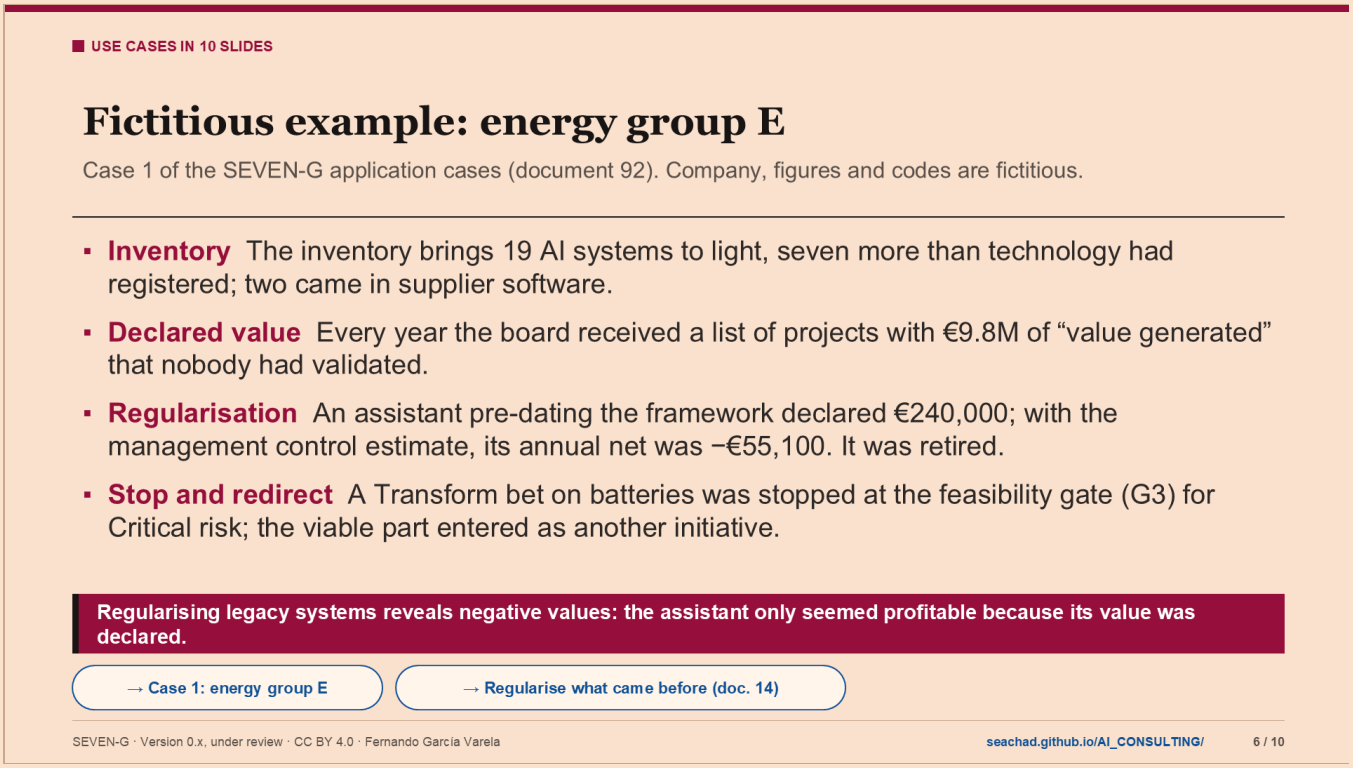

Why it matters: with these pieces, each case leaves a trail from day one and the board can also see those that did not make it, and why.

Notes

This example is fictitious. It is case 1 in SEVEN-G document 92: an energy group with electricity distribution, renewable generation, a retail supplier and field services. It has used AI for years, with strong technical teams. All figures are illustrative.

What it shows about use cases:

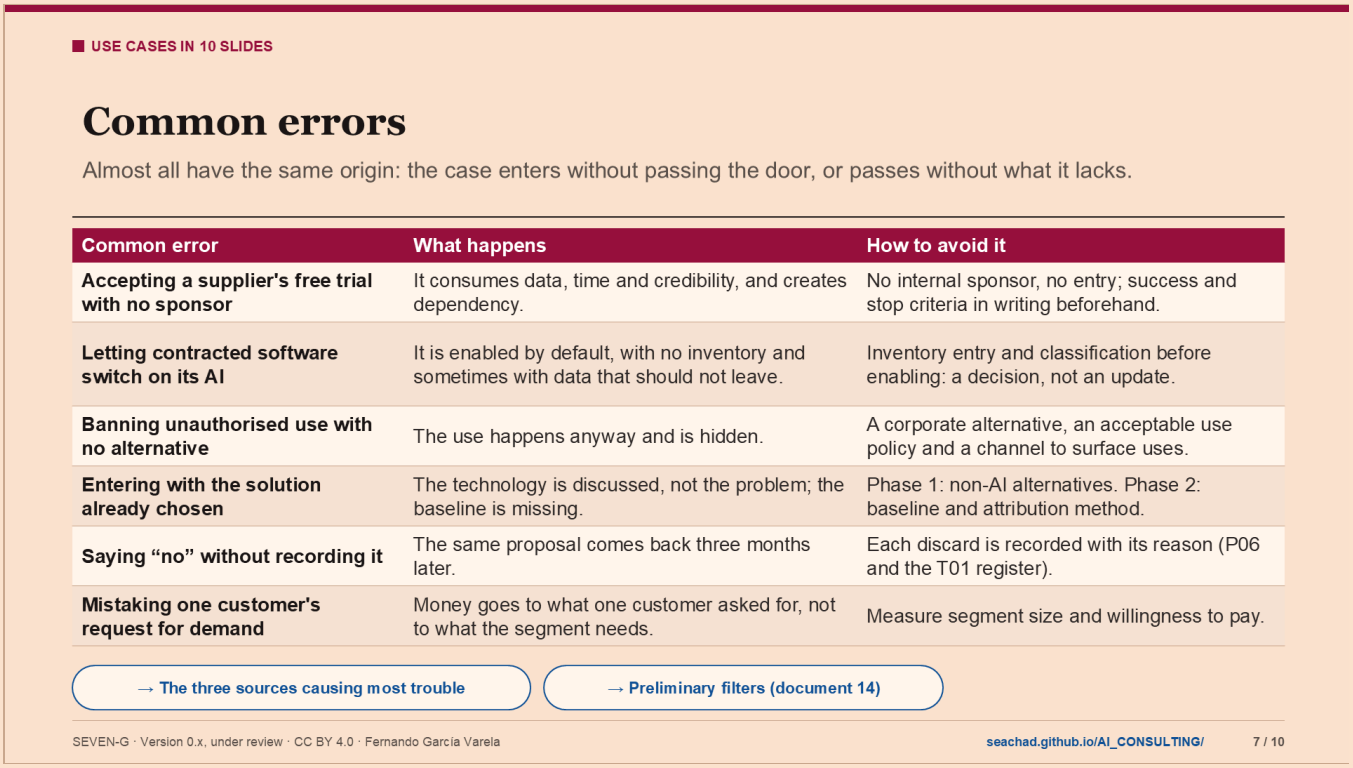

- AI that comes in without passing through the door exists. When the inventory is carried out, 19 AI systems come to light, seven more than the technology area had registered, and two of them came included in supplier software.
- Declared value is not value. Every year the board received a list of projects with €9.8M of "value generated" that nobody had validated.
- Regularising what pre-dates the framework reveals surprises. A conversational assistant for outages was already in production. The area declared €240,000 of calls avoided, with no baseline. Management control estimated from a sample 9,500 calls avoided at €4.20 each: €39,900. With a recurring cost of €95,000, the annual net value was −€55,100. At the review equivalent to G7 it was decided to retire it, with a replacement that is not AI.
- Stopping is also an outcome. A Transform bet (autonomous battery management with bids in the electricity market) was stopped at the feasibility gate (G3): orders in the market cannot be reversed and the residual risk was Critical, outside the approved appetite. €85,000 of the €250,000 for the stage was consumed. The viable idea, optimising battery charging with a person who decides, entered as a separate initiative, with a different value hypothesis and a different sponsor.

Why it matters: the single door and the register do not slow innovation down; they separate what brings value from what only seemed to.

Question for the classroom: what would have happened if the board had accepted the Critical risk of the batteries so as not to miss the opportunity? What should have been recorded in that decision?

USE CASES IN 10 SLIDES

Common errors

Almost all have the same origin: the case enters without passing the door, or passes without what it lacks.

Common error	What happens	How to avoid it
Accepting a supplier's free trial with no sponsor	It consumes data, time and credibility, and creates dependency.	No internal sponsor, no entry; success and stop criteria in writing beforehand.
Letting contracted software switch on its AI	It is enabled by default, with no inventory and sometimes with data that should not leave.	Inventory entry and classification before enabling: a decision, not an update.
Banning unauthorised use with no alternative	The use happens anyway and is hidden.	A corporate alternative, an acceptable use policy and a channel to surface uses.
Entering with the solution already chosen	The technology is discussed, not the problem; the baseline is missing.	Phase 1: non-AI alternatives. Phase 2: baseline and attribution method.
Saying "no" without recording it	The same proposal comes back three months later.	Each discard is recorded with its reason (P06 and the T01 register).
Mistaking one customer's request for demand	Money goes to what one customer asked for, not to what the segment needs.	Measure segment size and willingness to pay.

→ The three sources causing most trouble → Preliminary filters (document 14)

SEVEN-G · Version 0.x, under review · CC BY 4.0 · Fernando García Varela seachad.github.io/AI_CONSULTING/ 7 / 10

Notes

The most common errors with use cases repeat from one company to the next. Almost all have the same origin: the case enters without passing through the door, or passes through it without what it lacks.

- The free proof of concept. It seems to cost nothing, but it consumes data, team time and credibility, and creates dependency on the supplier. SEVEN-G asks, before starting, for a sponsor, success and stop criteria in writing, bounded data and an exit cost estimated from day one.
- AI that already comes included in a contracted product. It is enabled by default, with no decision and no inventory, and sometimes with data that should not leave the perimeter. It is handled with a periodic review of supplier release notes, inventory registration and classification before enabling it, and the clauses in document 36.
- Banning unauthorised use with no alternative. The use happens anyway; banning it only hides it. A usable corporate alternative, an acceptable use policy and an amnesty channel to surface uses work better.
- Entering with the solution already chosen. It is the typical bias of business units. Phase 1 requires looking at non-AI alternatives and phase 2 requires measuring the baseline.
- Saying "no" without recording it. A discard with no recorded reason is proposed again months later.
- Mistaking one customer's request for aggregate demand. Segment size and willingness to pay are missing.

Why it matters: according to document 54, most of a company's regulatory and security risk does not sit in the initiatives in its portfolio, but in what never reached it.

Question for the classroom: which of these errors have you seen in your organisation? What would have prevented it?

Notes

These questions work for a board, a management committee or a classroom session. The first four come from SEVEN-G document 54, in its “on demand” and “on reporting” blocks. The last one invites you to use the gallery by sector.

How to use them in a session:

- Ask each group to think of a company they know well, their own or one from a case study.
- For the first question, ask them to classify the initiatives by the eight sources. If all come from technology, business sponsorship is missing. If none come from employees, perhaps the use exists but is not visible.
- For the second, ask them to think of the software the company already pays for: email, office tools, customer management, people management. Who decided to enable its AI features?
- For the third, ask them to distinguish between banning, tolerating and offering an alternative with rules. Document 31 proposes the third way.
- For the fourth, ask them to check whether reporting to the board includes stopped or retired initiatives and their reason. If only successes are visible, the board does not learn.
- For the fifth, ask them to open the gallery by sector and compare the use cases of their sector with their own portfolio.

Why it matters: these questions have no right answer. Either there is an answer or there is not, and that is already information for management.

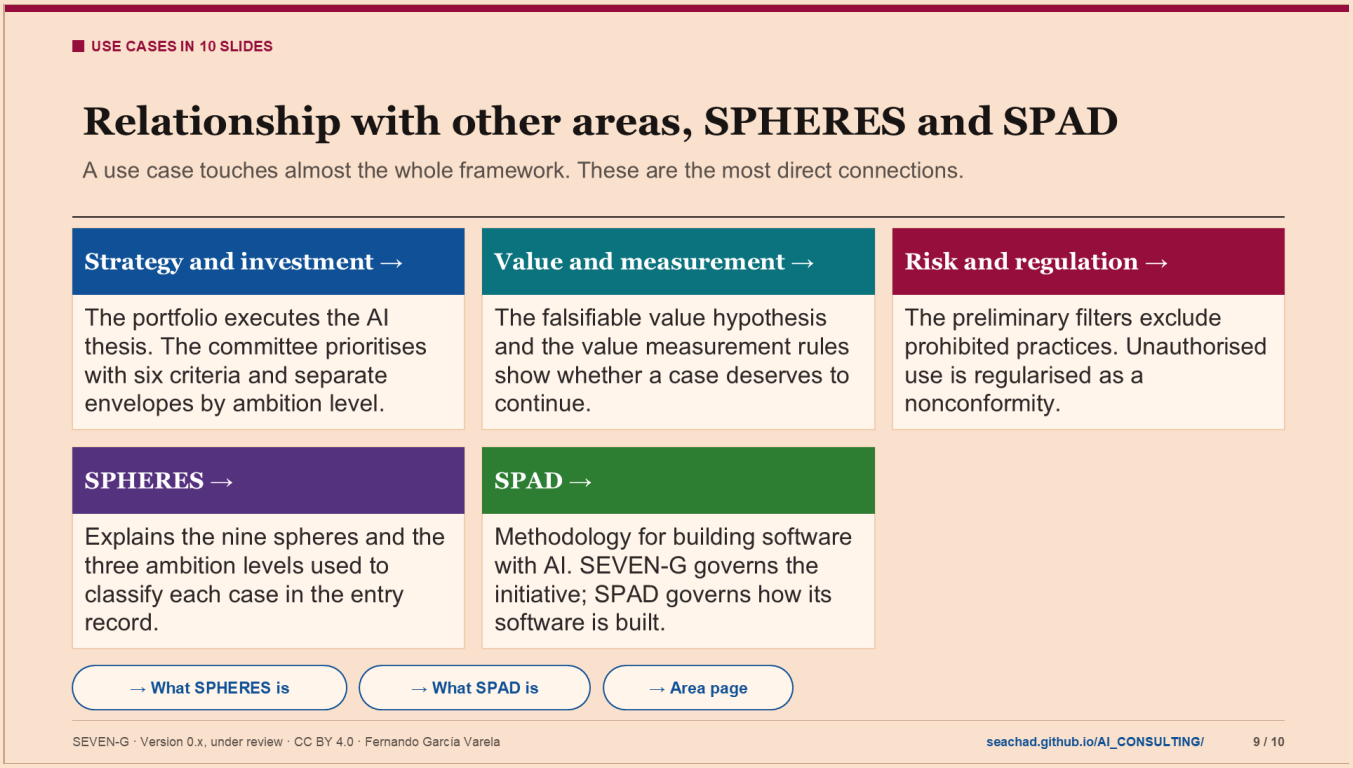

To work in more detail, document 92 proposes a discussion question for each of its eight fictitious cases.

Notes

Use cases are the entry door to almost the whole framework. These are the most direct connections.

- Strategy and investment. The portfolio executes the AI thesis approved at stage C2. At stage C3, the AI Committee prioritises with six criteria (additional net value per euro, fit with the thesis, contribution to ambition by sphere, risk, data dependency and capacity) and each ambition level competes only within its envelope. That way a Transform bet does not compete with an optimisation with immediate return.
- Value and measurement. The falsifiable value hypothesis of phase 2 and the measurement rules in document 40 show whether a case deserves to continue. One of them, rule 10, requires each use case to explain what it is and what it is used for, in understandable language.
- Risk and regulation. The preliminary filters leave out practices prohibited by regulation. Detected unauthorised use is recorded and regularised as a nonconformity, with time limits according to its severity.
- SPHERES. It is the supporting methodology that explains the nine spheres where AI generates value and the three ambition levels: Optimise, Augment and Transform. The minimum entry record asks for the proposed sphere and ambition of each case, and SPHERES helps to do it well. Its operational rules are in SEVEN-G document 10.
- SPAD (Structured Prompt-Driven Engineering). It is a methodology independent of SEVEN-G. SEVEN-G governs the initiative as a whole: value, risk and decision gates. SPAD governs how the software is built when it is done with AI assistance.

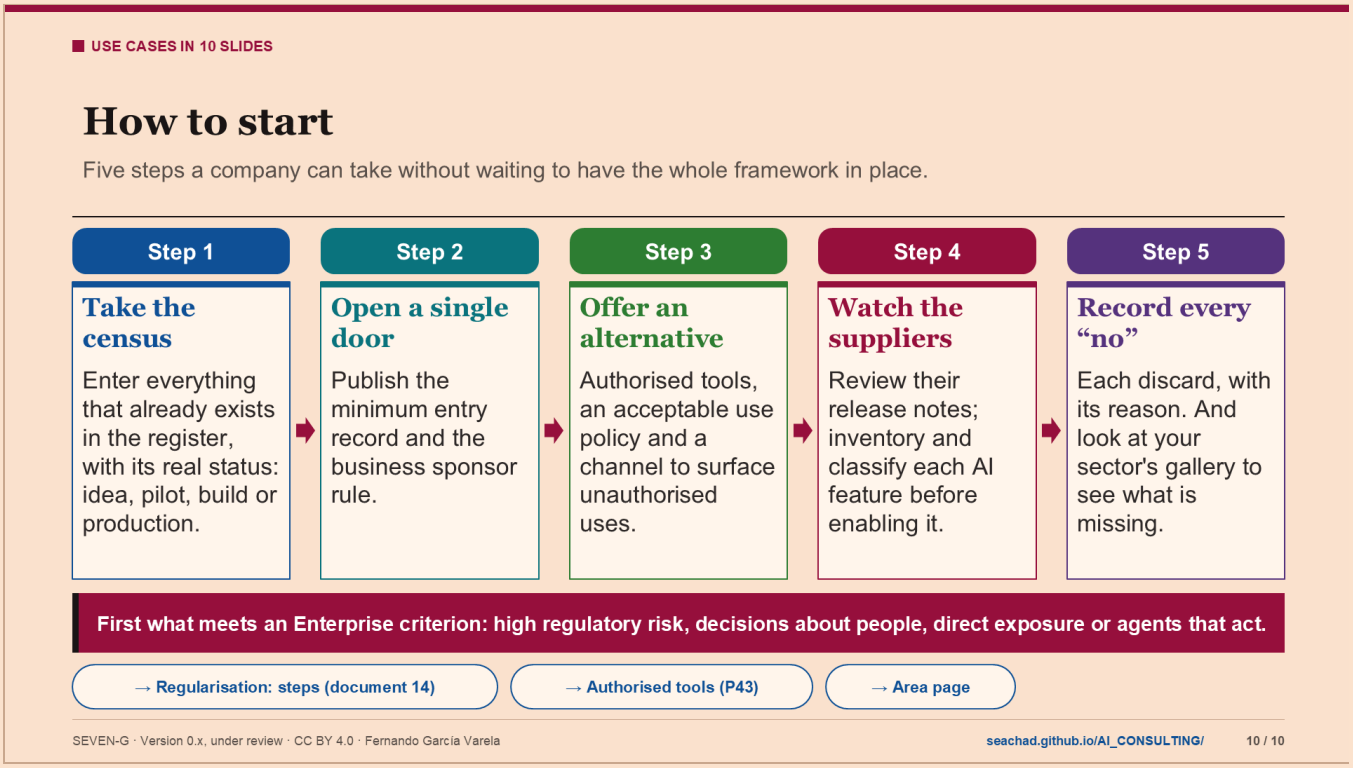

Why it matters: a use case that enters properly already brings the information that strategy, value and risk need. What is not asked for at the door is paid for later.

Question for the classroom: which area suffers most in your company when a case enters with no record and no sponsor?

Notes

You do not need the whole framework in place to put use cases in order. These five steps come from SEVEN-G documents 14, 31 and 54.

- Step 1. Take the census. Enter in the initiative register (T01) and in the inventory everything that already exists, with its real status: idea, pilot, build or production. Start with what meets an Enterprise criterion: high regulatory risk, decisions about people, direct exposure or agents that act. What is already in production goes through a review equivalent to gate G7; a pilot is assessed at the feasibility gate (G3). Regularisation documentation carries its real date: it cannot be presented as earlier.
- Step 2. Open a single door. Publish the minimum entry record in document 14 and the sponsor rule: without an internal business sponsor, no proposal enters.
- Step 3. Offer an alternative. Publish which AI tools may be used and with what information (P43), approve the acceptable use policy (document 31) and open a channel for employees to surface what they already use. Banning with no alternative only hides the use.
- Step 4. Watch the suppliers. Review the release notes of contracted software and treat each new AI feature as a decision: inventory registration and classification before enabling it.
- Step 5. Record every "no". Each discard carries its reason, with the opportunity portfolio (P06). And open the gallery by sector to compare your own portfolio with what the sector is adopting.

Why it matters: in a few weeks, these steps give a real picture of the company's AI and a door for whatever comes next. It is the basis for everything else.

Question for the classroom: if you had to take the census in your company tomorrow, which three systems do you think would appear without anyone having registered them?
