

## Notes

SEVEN-G stands for Seven-phase Enterprise Value & Governance: an enabling phase 0, seven value phases and governance present in all of them. It is a complete and free method for a company, a consultancy or an independent professional to implement, govern and measure the artificial intelligence of an organisation.

The central message of this presentation is simple. AI is not just another technology or product. It enables, accelerates and transforms the company. That is why it is treated as a strategic asset. Its decisions do not belong only to the technology area: they belong to the board of directors, the chief executive and the finance function.

SEVEN-G does not say which technology to buy. It helps to answer three management questions with the data of the company's own portfolio:

- Where to invest: in which areas AI has the most impact and whether investment follows the strategy.
- How to scale: what prevents moving from pilots to production today and where to start.
- How to prove value: how much each euro returns and what share of that figure is validated.

Why it matters. If AI is treated as a technical project, the board receives a list of projects and cannot prioritise, demand or oversee. If it is treated as a strategic asset, the board decides the ambition, the risk it accepts and the capital it allocates, and asks for evidence.

Example. Two companies spend the same on AI. The first has twenty pilots with no owner. The second has a portfolio with phases, owners and validated figures. Only the second can tell the board what to stop and what to scale.

Question for the classroom: in your organisation, who decides on AI today, and with what information?

## SEVEN-G IN 10 SLIDES

- **What SEVEN-G is** https://seachad.github.io/AI_CONSULTING/SEVEN-G/html/en/entrada/index.html
- **Quick start (document 00)** https://seachad.github.io/AI_CONSULTING/SEVEN-G/html/en/00_SEVEN-G_Que_es_y_para_que_sirve.html#quick-start

## Notes

In most organisations AI grows faster than their ability to govern it. The symptoms repeat in any sector: the board receives an inventory of technical projects instead of business decisions; there are many pilots and few cases in production; value is declared, but nobody validates it; there are no criteria to stop; whoever builds also approves; and regulatory and security risk is addressed late.

SEVEN-G starts from one premise: these problems are not corrected with more technology or more pilots. They are corrected with governance and measurement. That is why the framework speaks both to those who build and to those who decide and oversee.

The six questions on the slide are the ones the board ends up asking. Each card links to a page on the site that explains how SEVEN-G answers it and where to see it in the example:

- Progress is measured with a funnel, not with a list of projects.
- Profitability is measured with the full cost against validated value.
- Doing more requires a sphere map and a maturity reading.
- Transformation is told apart from efficiency with eight observable signals.
- Stopping in time requires decision gates with criteria set in advance.
- Risk is controlled with an inventory, separate roles and evidence.

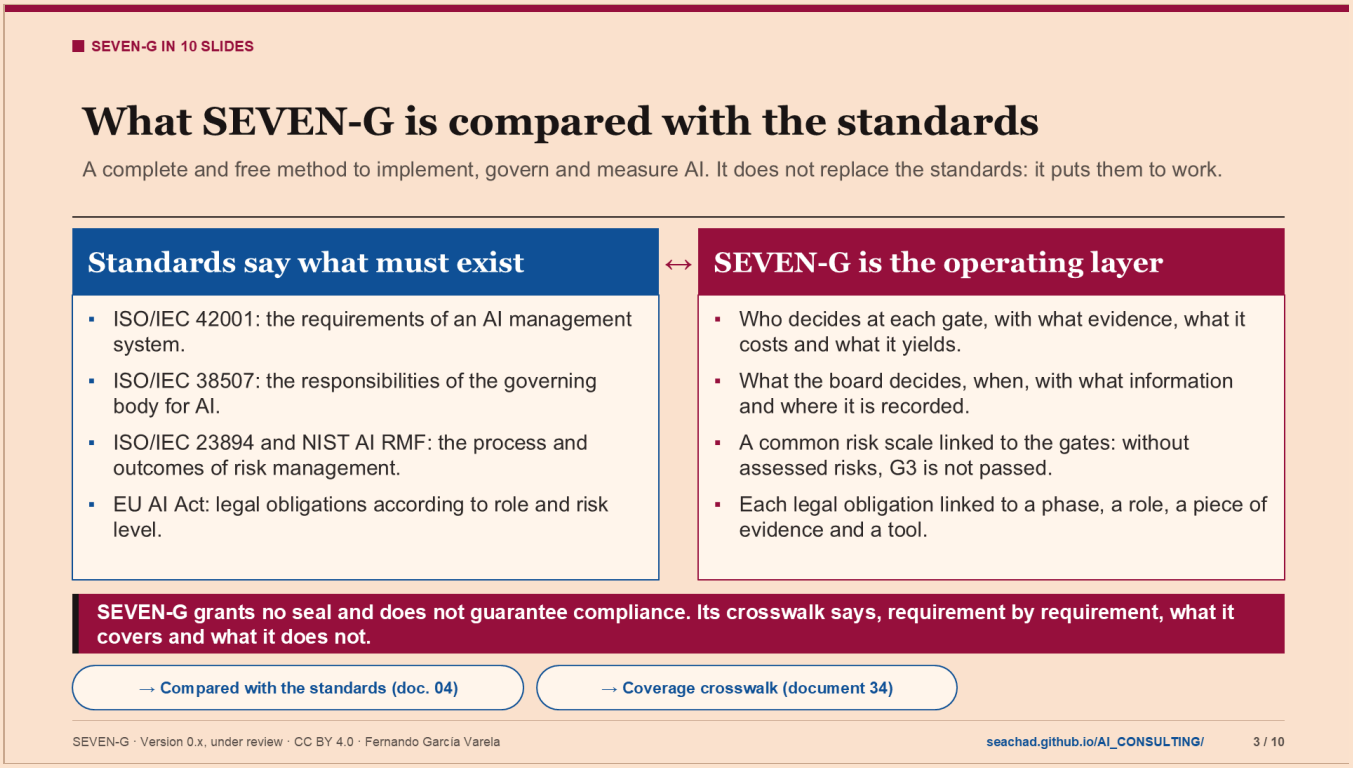

Why it matters. If each answer is a spreadsheet and an opinion, the board cannot exercise its oversight responsibility. With a single register, the same question gets the same answer every quarter.

Example. A company announces savings of thousands of hours thanks to an assistant. Nobody has reduced cost or reassigned those hours. For SEVEN-G, that saving does not exist yet.

Question for the classroom: which of the six questions would be the hardest to answer in your organisation today, and why?

## Notes

SEVEN-G is presented as an AI operating model. Standards and regulation say what must exist: a management system, responsibilities of the governing body, a risk process, impact assessments and legal obligations. SEVEN-G is the layer that makes it work, initiative by initiative and portfolio by portfolio, with investment and value discipline.

What the framework adds to each reference:

- To ISO/IEC 42001, the lifecycle of each initiative with gates and verifiable criteria, the portfolio as a funnel and value measurement; the evidence an audit asks for is already prepared.
- To ISO/IEC 38507, what the board decides and when, with what information and where the decision is recorded.
- To ISO/IEC 23894, a common 5 × 5 risk scale, standard risks and acceptance by the body at the right level.
- To the NIST AI RMF, current and target profiles derived from the same maturity questionnaire.
- To the EU AI Act, each obligation linked to a phase, a role, a piece of evidence and a tool.

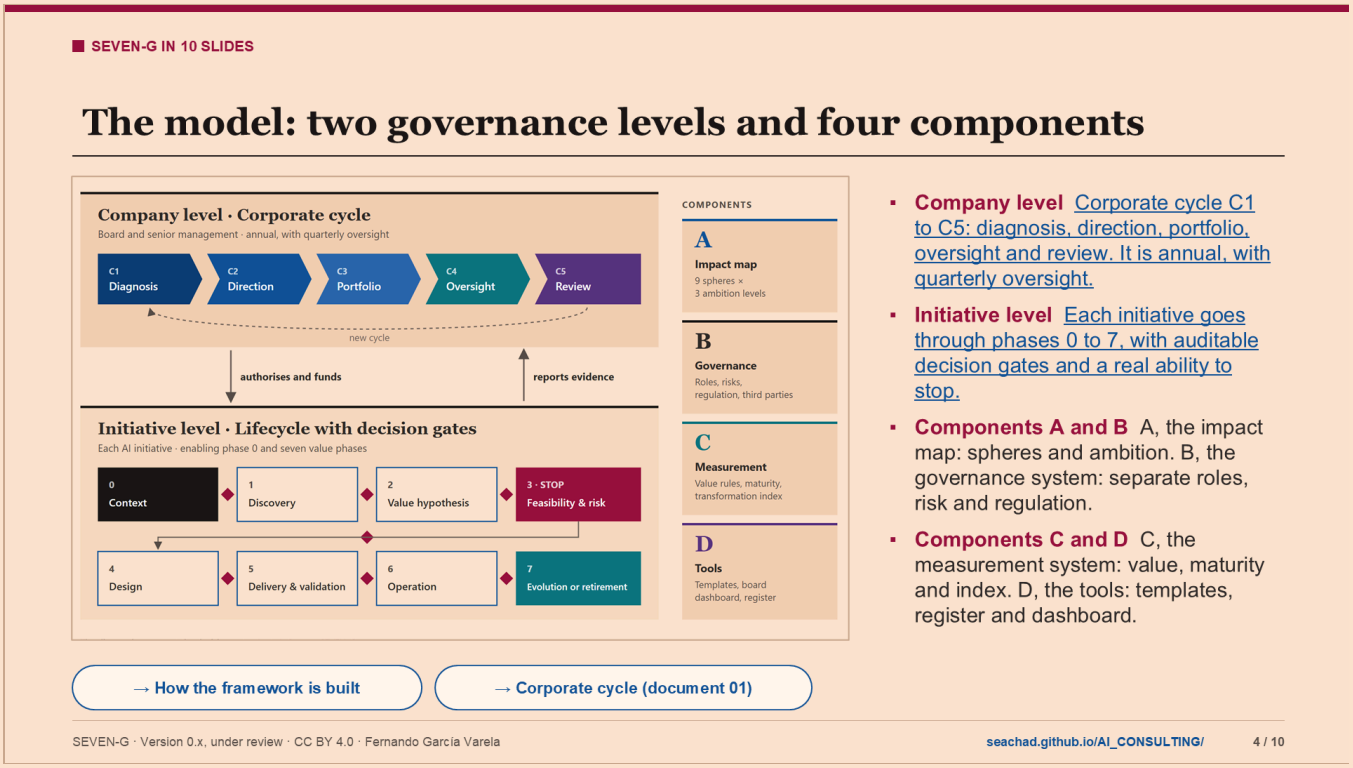

What SEVEN-G is not: it does not replace ISO/IEC 42001, it grants no seal and it does not guarantee compliance with the EU AI Act. The declaration of application is a self-declaration that an audit can verify. Each organisation is accountable for its own compliance.

Why it matters. Those who already work with a standard are not looking for another one to replace it, but for a way to put it to work without duplicating effort. Saying precisely what the framework covers avoids two costly mistakes: believing the framework is enough to comply and believing one has to choose between the framework and the standard.

Question for the classroom: if your company already has a risk management system, what would it lack to govern an AI portfolio?

## Notes

SEVEN-G is organised into two governance levels and four components used at both levels.

The company level is the corporate cycle, where the board and senior management exercise their role:

- C1 · Diagnosis: where are we? Maturity with evidence, current sphere map and inventory of AI systems.
- C2 · Direction: where do we want to play, with what ambition and what risk appetite? It is the company's AI thesis.
- C3 · Portfolio: which initiatives do we fund and which do we stop?
- C4 · Oversight: is what was decided being delivered? Board dashboard, gate decisions and incidents.
- C5 · Review: have we made progress? Are we transforming?

The initiative level is the lifecycle: each initiative goes through eight phases and, at the end of each one, a decision gate checks the result and the documentation.

The four components are: A, the impact map, which says where and with what ambition to use AI; B, the governance system, with separate roles and regulation translated into phases, roles and evidence; C, the measurement system, with value per use case, maturity and the transformation index; and D, the tools, which turn the method into daily work.

Why it matters. Without a corporate cycle, AI decisions stay in isolated projects. Without a lifecycle, the board sets the direction but does not know what happens in each initiative. Both levels are needed.

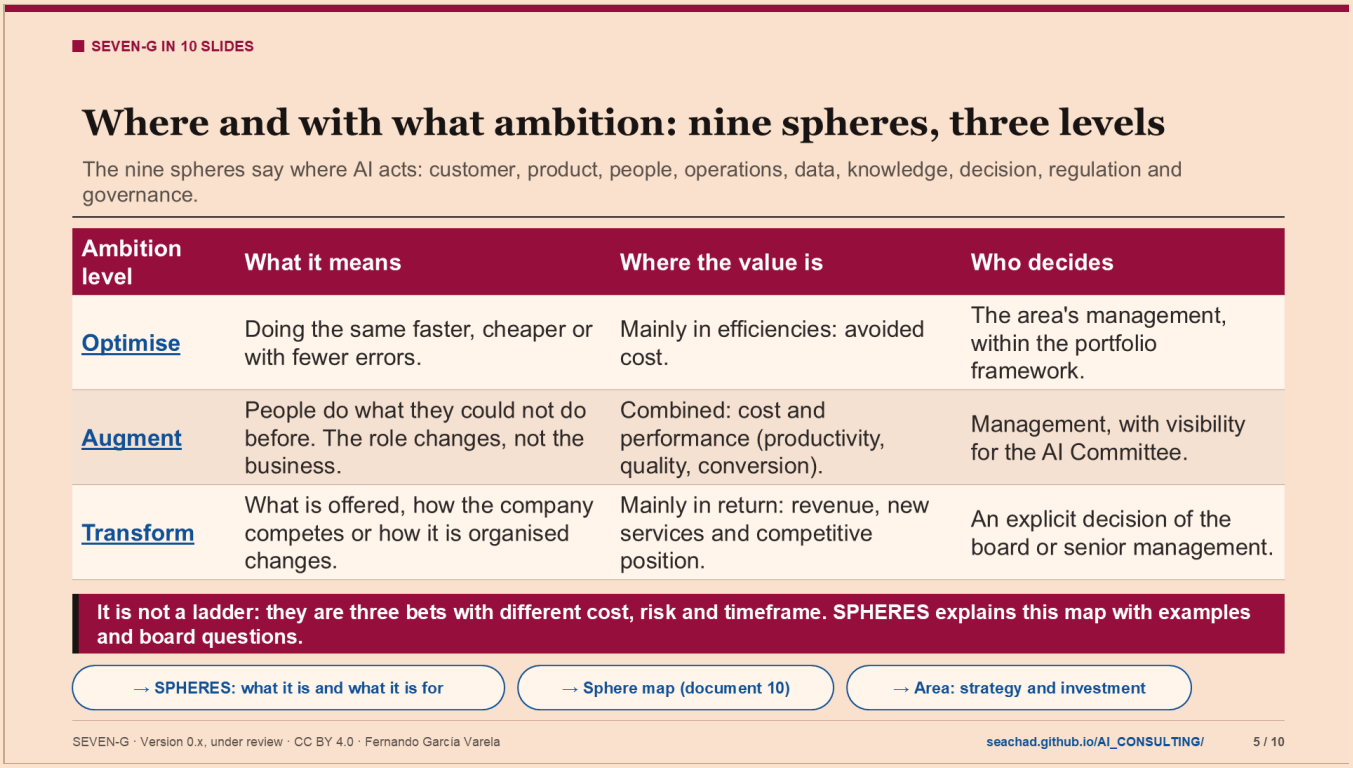

Example. A first implementation can concentrate C1 to C3 in ninety days: diagnosis in month 1, risks and opportunities in month 2 and governance structure in month 3.

Question for the classroom: which stage of the corporate cycle do you think is missing most often in companies?

■ SEVEN-G IN 10 SLIDES

## Where and with what ambition: nine spheres, three levels

The nine spheres say where AI acts: customer, product, people, operations, data, knowledge, decision, regulation and governance.

| Ambition level | What it means | Where the value is | Who decides |
|---|---|---|---|
| Optimise | Doing the same faster, cheaper or with fewer errors. | Mainly in efficiencies: avoided cost. | The area's management, within the portfolio framework. |
| Augment | People do what they could not do before. The role changes, not the business. | Combined: cost and performance (productivity, quality, conversion). | Management, with visibility for the AI Committee. |
| Transform | What is offered, how the company competes or how it is organised changes. | Mainly in return: revenue, new services and competitive position. | An explicit decision of the board or senior management. |

**It is not a ladder: they are three bets with different cost, risk and timeframe. SPHERES explains this map with examples and board questions.**

→ SPHERES: what it is and what it is for | → Sphere map (document 10) | → Area: strategy and investment

SEVEN-G · Version 0.x, under review · CC BY 4.0 · Fernando García Varela seachad.github.io/AI_CONSULTING/ 5 / 10

# Notes

The impact map (component A) makes it possible to talk about AI without talking about technology. A board does not decide on use cases: it decides on risk, opportunity, competitive advantage and accountability.

The nine spheres apply to any sector. Four are where value is created: 01 Customer, 02 Product and service, 03 People and 04 Operations. Three are enablers: 05 Data, 06 Knowledge and 07 Decision. Sphere 08, Regulation, ethics and accountability, sets the boundaries. Sphere 09, AI governance, is the meta-sphere that connects the others. Spheres 08 and 09 are not assessed with the three ambition levels, because they do not create value on their own: they have their own grades.

The three ambition levels are not a ladder. They are three types of bet with different cost, risk, timeframe and organisational resistance. Five questions classify each initiative: whether it changes the value proposition to the customer, whether the process is redesigned end to end, whether roles or decisions change, whether it generates new revenue and whether it could be retired by returning to the previous cost. If the first four are negative, the initiative is Optimise, however it is presented.

Why it matters. Without a map, the portfolio fills with initiatives that are technically attractive but strategically disordered. The map forces decisions on where to create value, what ambition to take on and what will not be funded.

Relationship with SPHERES. SPHERES is the methodology that explains this map in detail, with examples, warning signs and a conversation script per sphere. The operating rules, indicators and tools are in SEVEN-G.

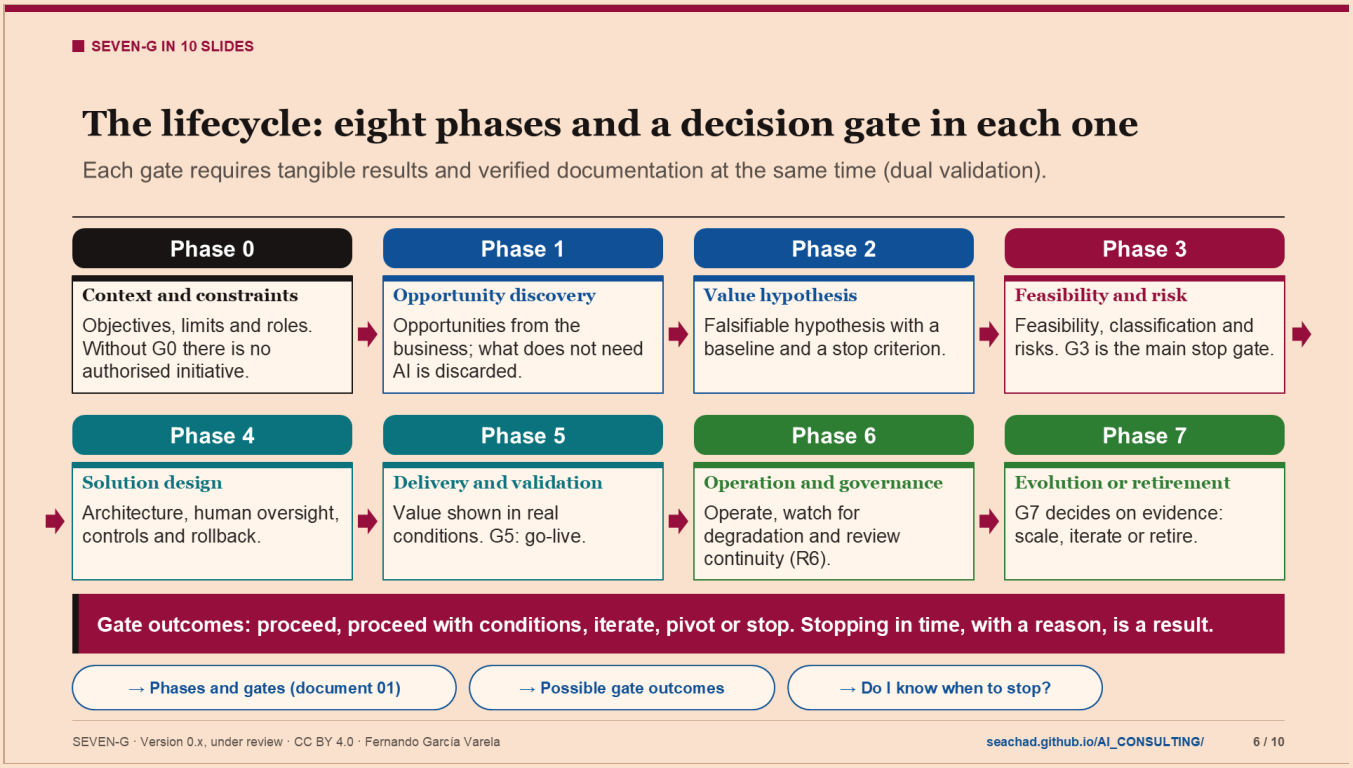

Question for the classroom: think of an AI initiative you know. Which sphere is it in and at what ambition level? Does that match how it was presented?

## Notes

Each AI initiative goes through eight phases. Phase 0 is enabling: without it, the initiative is not authorised. The seven phases that follow take the initiative from the opportunity to demonstrated value. The G in SEVEN-G expresses that governance is present in all of them.

At the end of each phase there is a decision gate. The sequence is always the same: the team provides the evidence, someone independent verifies it and the competent body decides. Nobody decides on their own work, and documentation produced after the fact to justify progress invalidates the gate.

The possible outcomes are:

- Proceed: the criteria are met and the evidence is verified.
- Proceed with conditions: non-critical points remain, with a deadline and an owner. It is never accepted for security, legal compliance or human oversight.
- Iterate: the phase is repeated because the result falls short, but the idea is still plausible. After two iterations, the decision is escalated to the higher body.
- Pivot: a new hypothesis in phase 2. Only at G1, G2 and G3.
- Stop: there is no plausible value or the risk is unacceptable. The reason and the lessons are recorded.

At G7 the outcomes are scale, iterate or retire.

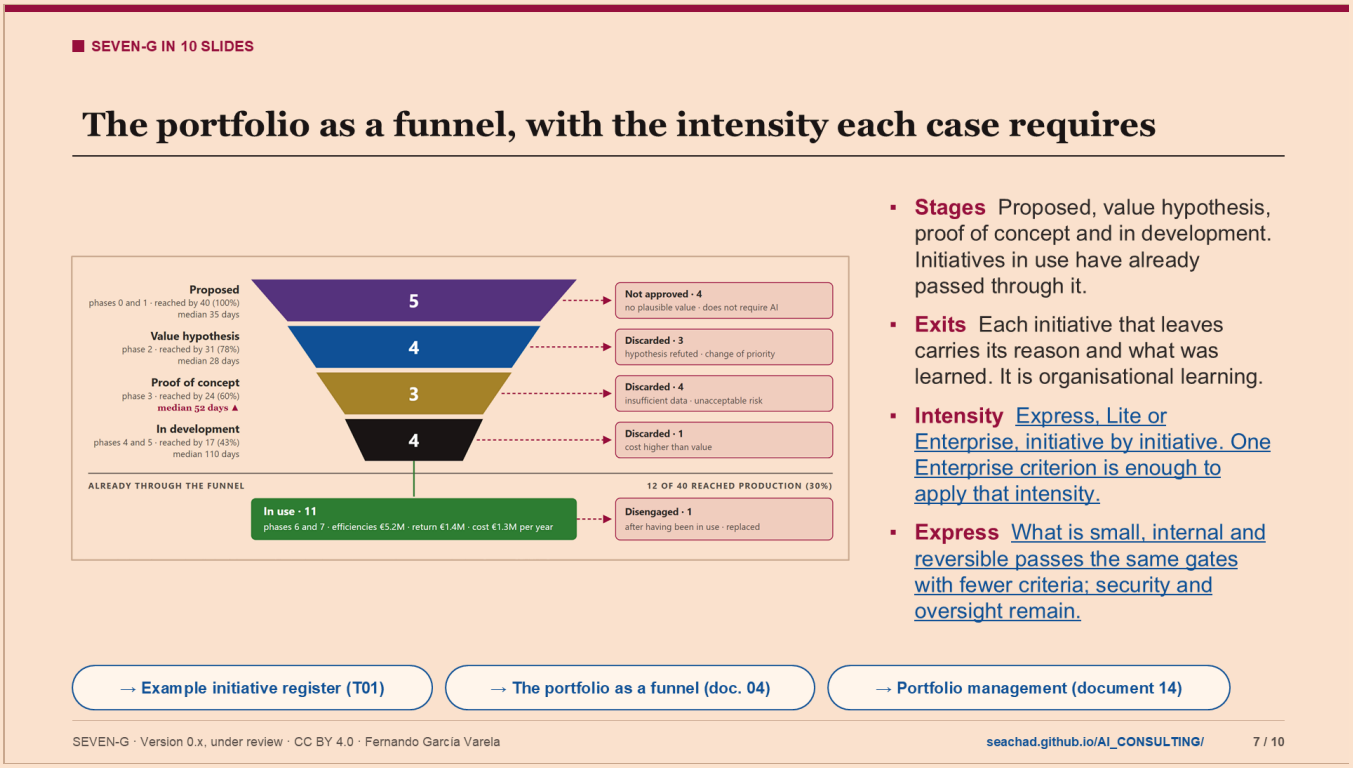

Why it matters. The lifecycle avoids two costly mistakes: going live without evidence and keeping initiatives without value through inertia. G3, feasibility and risk, comes before the heavy investment; that is why it is the main stop gate and is always decided separately.

Example. In phase 2, the measured saving falls below the target, but the team sees a specific adjustment. The initiative iterates: it repeats the phase with that adjustment and returns to the same gate.

Question for the classroom: why do you think a limit of two iterations protects the company?

## Notes

SEVEN-G reads the set of AI initiatives as a traditional sales funnel. To reach production, each initiative passes through mandatory states, and in each one it can move forward, wait or drop out. Registering an initiative in the initiative register (T01) is like recording an opportunity in a CRM: from then on it is known which stage it is in, how many days it has been there, what cost and value are expected and, if it leaves, why it left.

The stages group the phases: Proposed (phases 0 and 1), Value hypothesis (phase 2), Proof of concept (phase 3) and In development (phases 4 and 5). Initiatives In use (phases 6 and 7) have already passed through the funnel. Those that disengage after being in use are tracked separately, with their reason.

Intensity decides how much control each initiative needs:

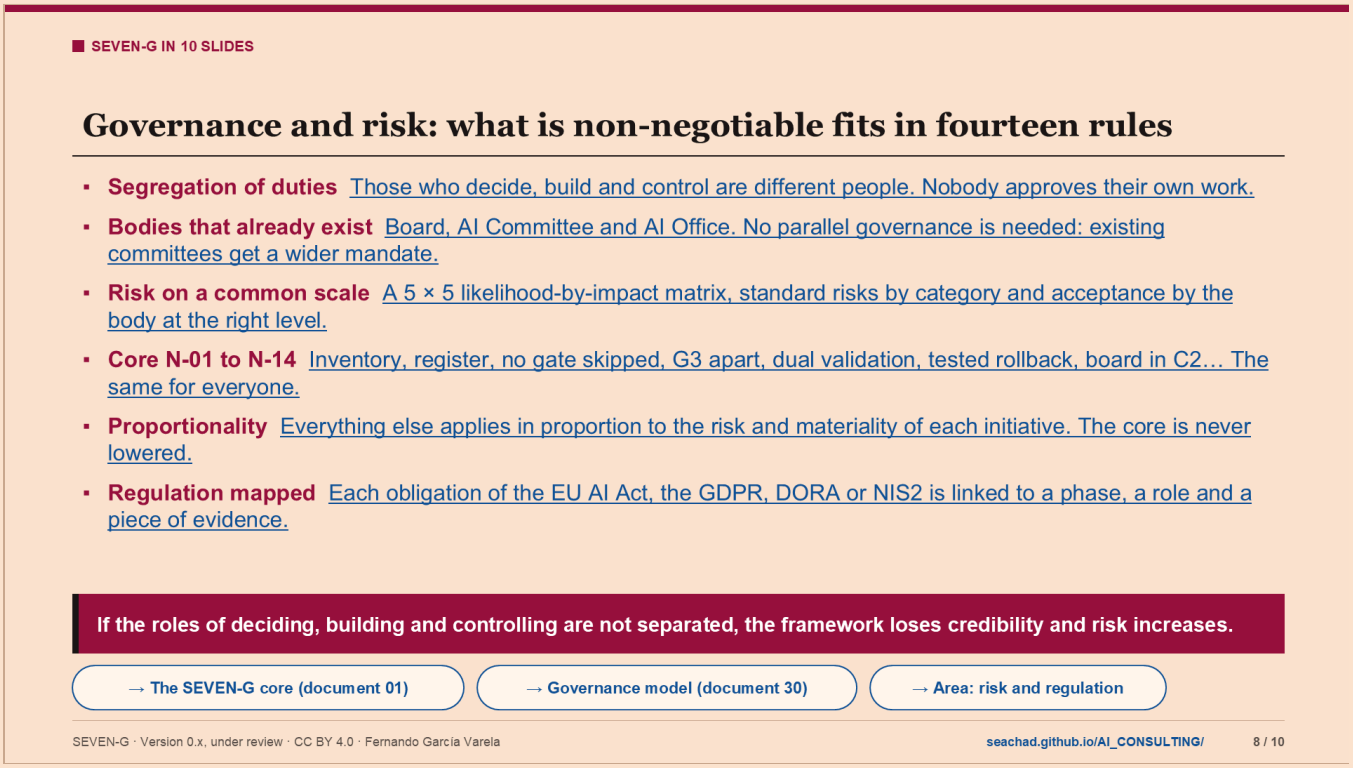

- Enterprise: one criterion is enough, for example high regulatory risk, decisions about people, direct customer exposure, agents that act, specially protected data or an investment above the C2 threshold. All gates separately and an AI Auditor at each one.
- Lite: low risk and internal use. Some gates are grouped and the templates are simplified.
- Express: small, internal, reversible within days and without sensitive data. The same gates with a reduced list of criteria and a living record. The risk function confirms it, never the sponsor alone, and G3 is still decided separately.

Why it matters. The funnel shows at a glance what a list hides: where the portfolio gets stuck. Intensity prevents a cheap internal assistant from paying for the path of an agent that serves customers; otherwise, small cases stop being registered.

Question for the classroom: what would a board learn from the initiatives that do not pass the proof-of-concept stage?

- **Portfolio management (document 14)** https://seachad.github.io/AI_CONSULTING/SEVEN-G/html/en/14_SEVEN-G_Gestion_de_cartera.html

## Notes

The governance system (component B) answers one question: who decides, who builds and who controls? In each initiative there is a sponsor who is accountable for value and authorises the investment; product, technical and operations owners who build and operate; and a risk owner and an AI Auditor who control. Whoever builds does not audit and nobody approves themselves.

In the company there are three bodies: the board sets the thesis, the ambition and the risk appetite, and oversees; the AI Committee manages the portfolio and decides the higher-level gates; the AI Office maintains the inventory and the methodology and consolidates measurement. They can be existing committees with a wider mandate.

Risk is assessed across the company on the same scale: likelihood by impact in a 5 × 5 matrix, standard risks by category (among them generative AI and agents, security and third parties) and acceptance of residual risk by the body that corresponds to its level. A Critical residual risk without board approval blocks G3 and G5.

The core is fourteen rules, from N-01 to N-14, the same for every company, intensity and scope: complete inventory, registration of every initiative, determined intensity, no phase or gate skipped, G3 decided separately, segregation of duties, dual validation, security, compliance and human oversight criteria never accepted as a condition, value hypothesis with a stop criterion, classification and risks before design, tested rollback, the board in C2, measurement with rules and managed nonconformities.

Why it matters. The core gives the company a clear and verifiable minimum. Proportionality prevents governance from becoming a heavy procedure for small things.

Question for the classroom: which core rule do you think is broken most often in companies today?

# Measuring value and taking it to the board

- **Value with a status** Each amount has a formula and a status: validated, declared or estimated. “No data” is not zero.
- **Board dashboard (T17)** Full cost against value, validated share, what holds back scaling and where the impact is.
- **Index and maturity** Eight signals say whether it transforms or only gains efficiency; maturity measures seven dimensions from 0 to 5.
- **Screenshot in Spanish** Example dashboard: fictitious company and illustrative figures.

→ Example board dashboard | → Value measurement rules | → What holds back scaling (document 60)

SEVEN-G · Version 0.x, under review · CC BY 4.0 · Fernando García Varela seachad.github.io/AI_CONSULTING/ 9 / 10

## Notes

The measurement system (component C) has three instruments.

First, value per use case and per portfolio, with ten rules. The most important: every amount has a formula and is incremental against a baseline; every amount has a status (validated by management control or audit, declared by the area or estimated); released capacity does not count as savings until it is materialised or reassigned; efficiencies, return and recurring cost are kept separate; and “no data” is not zero.

Second, the maturity model: seven dimensions (strategy and governance, value and portfolio, data and knowledge, technology and operations, people and adoption, risk, security and compliance, and measurement and evidence), from 0 to 5 and with observable evidence. The technology in use does not raise the score: it sets the minimum governance the company must have.

Third, the transformation index: eight observable signals, such as the composition of value, redesigned processes or AI-enabled revenue. They place the company in a profile: scattered exploration, tactical efficiency, efficiency at scale, transformation under way or declared but unevidenced transformation. The last one is the profile a board most needs to detect.

The board dashboard (T17) is generated from the same initiative register, without retyping anything. It shows cost, efficiencies, return and annual net value, the validated share, a reading of what holds back scaling (six brakes, from FE-1 to FE-6) and an impact map by sphere and ambition.

Example. The example dashboard shows a fictitious company with fifteen initiatives; all its figures are illustrative. The screenshot is in Spanish.

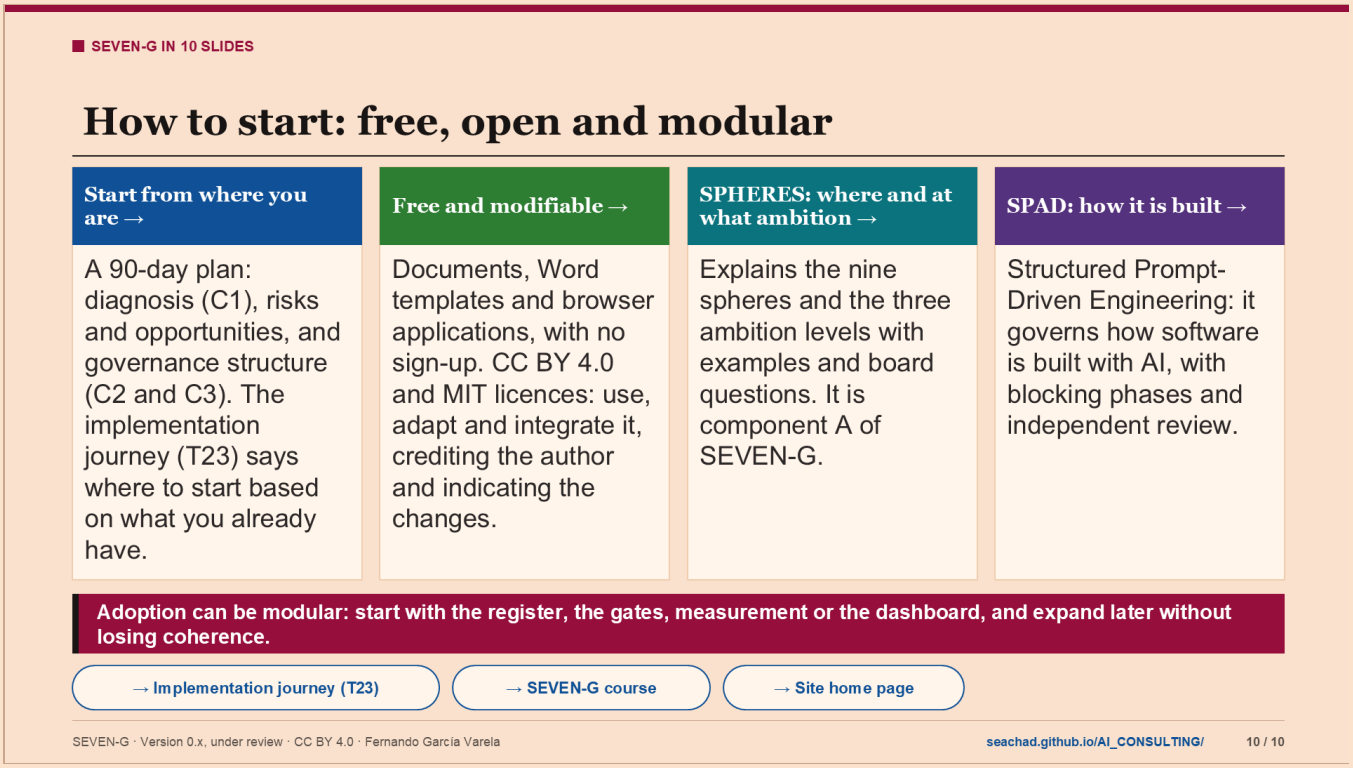

Why it matters. What is not measured with common rules cannot be compared or audited. With these rules, the board does not accept unvalidated benefits.

Question for the classroom: what share of the value announced in your organisation is validated?

## Notes

SEVEN-G does not require money, but it does require discipline: someone to drive it, an up-to-date initiative register and decisions taken with evidence on the table. Without a sponsor in management who takes the decisions and has a real ability to stop, the framework only produces documents.

How to start:

- The implementation guide proposes a 90-day plan: diagnosis in month 1 (C1), a map of risks and opportunities with an owner and economic impact in month 2, and a governance structure with gates, metrics and reporting rhythm in month 3 (C2 and C3).
- The implementation journey (T23) classifies the company's starting point, for example without AI, with third-party AI or with many pilots, and orders the milestones. The destination is the same for all; the order and the calendar change.
- Adoption can be modular: start only with the register, the gates, measurement or the dashboard.
- The Lite scope allows a medium-sized company to govern AI with its management committee, one part-time person and an external auditor.

Free and open. All the working material is on the site: documents, editable Word templates and applications that run in the browser, with no sign-up and no email. The content is licensed under CC BY 4.0 and the code under the MIT licence. Author: Fernando García Varela.

Relationship with the other frameworks. SPHERES is the explanatory layer for the nine spheres and the three ambition levels. SPAD governs how software is built with AI: explicit design before code, blocking phases and independent review of what the AI does. SEVEN-G governs the initiative as a whole and refers to SPAD for construction.

Why it matters. Starting from complete material lets the effort go into deciding rather than producing templates.

Question for the classroom: which component would you start with in your organisation, and why?
