

Notes

Central message: AI is not one more technology or one more product. It is an enabler, an accelerator and a transformer of the company. That is why it is a strategic asset, and its decisions (where to invest, how much risk to accept, when to stop) belong to the board, the chief executive and the chief financial officer, not only to the technology department.

SEVEN-G stands for Seven-phase Enterprise Value & Governance: a phase 0 that enables and seven value phases, with governance (G) present in all of them. It is a self-consulting framework: the company itself, or the consultancy that supports it, applies it without depending on the author.

This presentation covers the framework in twenty steps: the story, the board's questions, the model, the decision gates, the portfolio, risk, value, the board and implementation.

Example: a company buys licences for a generative AI assistant for all employees and treats it as an IT project. A year later nobody knows what value it has given or what data it has touched. With SEVEN-G that purchase is one more initiative: it has an owner, a value hypothesis, recorded risks and a gate before the big spend.

Why it matters: if AI is governed as a tool, the company spends without knowing whether it is making progress. If it is governed as a strategic asset, the board can decide with figures.

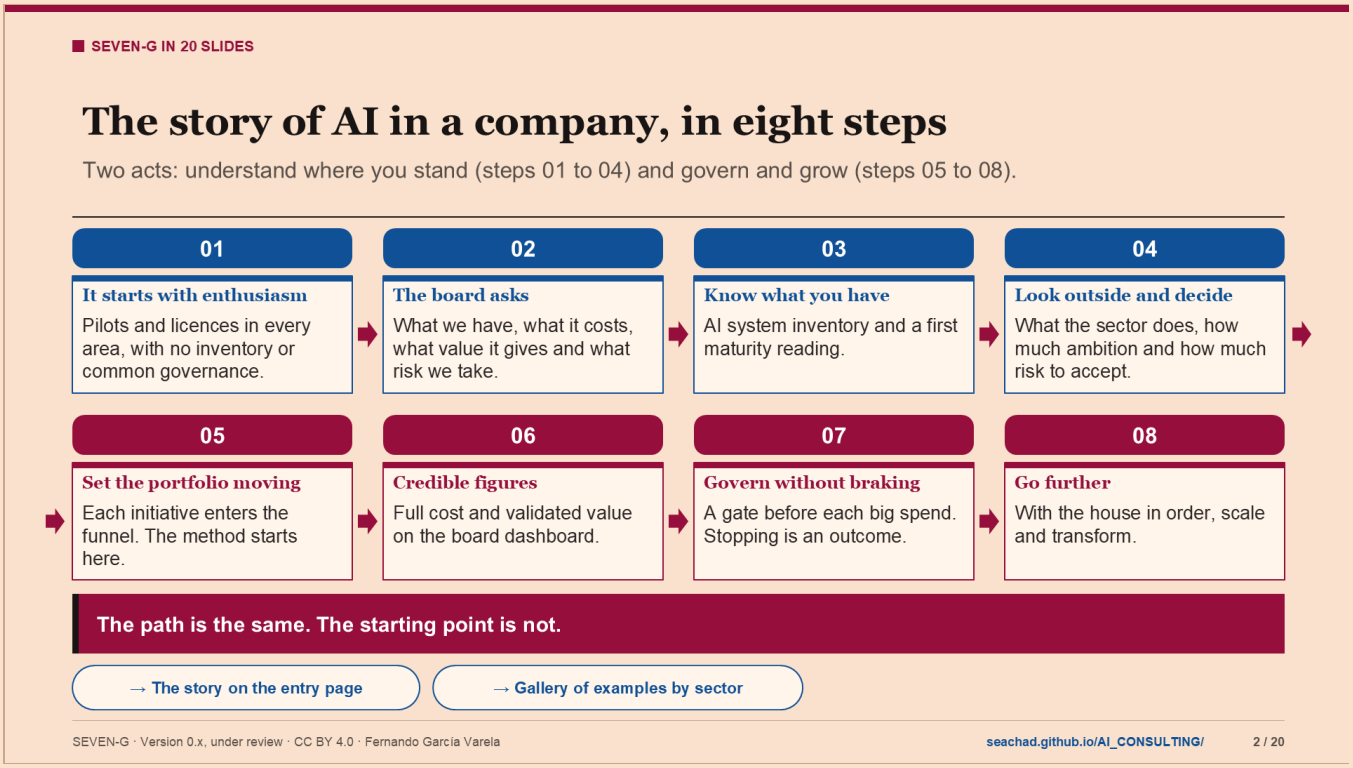

The framework is by Fernando García Varela. The content is published under the CC BY 4.0 licence and the code under the MIT licence: anyone can use and adapt it free of charge, citing the authorship.

Classroom question: in your company, or in one you know, who decides about AI today: technology, the business or the board?

Notes

The story sums up how AI reaches almost every company and where SEVEN-G comes in.

Act I, understand where you stand:

- 01. AI comes in through enthusiasm: pilots, licences and tests in every area, with no inventory or common governance.
- 02. The board starts to ask what there is, what it costs, what value it gives and what risk is taken. Nobody has the full answer.
- 03. First you must know what you have: the AI system inventory and a first maturity reading.
- 04. Then you look outside (what the sector does) and decide how much ambition and how much risk to accept.

Act II, govern and grow:

- 05. The portfolio starts to move like a funnel. The method starts here.
- 06. The board receives figures it can believe.
- 07. You govern without braking: a gate before each big spend, and stopping is a valid outcome.
- 08. With the house in order, the company goes further: it scales and transforms.

Why it matters: step 05 does not work without steps 03 and 04. Many companies start with the funnel or the tool and skip the inventory and the ambition decision. That is why they later do not know what to prioritise.

Example: two companies follow the same path; one starts from zero and the other has many pilots. The order of the milestones changes, the destination does not.

Classroom question: at which step is a company you know today? What does it need to move to the next one?

Notes

A board does not need to know how a language model works. It needs to answer six business questions, and each card leads to a site page with the answer in three ideas and where to see it.

- Progress: measured with the portfolio funnel (entries, conversions, times and stops).
- Profitable: measured with full cost against efficiencies and return, and only value that management control validates counts in the net figure.
- More: the impact map (spheres by ambition level) shows where there are gaps against the ambition the board approved.
- Transform: the transformation index separates evidenced transformation from declared transformation.
- Stop: each value hypothesis has stop criteria, and the feasibility gate (G3) is the main stop gate.
- Risk: each initiative has a regulatory classification and assessed risks, and each risk level is accepted by a specific body.

Why it matters: these questions organise the whole framework. Each SEVEN-G document, template and tool helps to answer at least one of them.

Example: a board member asks what stops us from scaling AI. The guide for the conversation with the board (document 61) records this and other difficult questions, with how to answer them without presenting a forecast as certain.

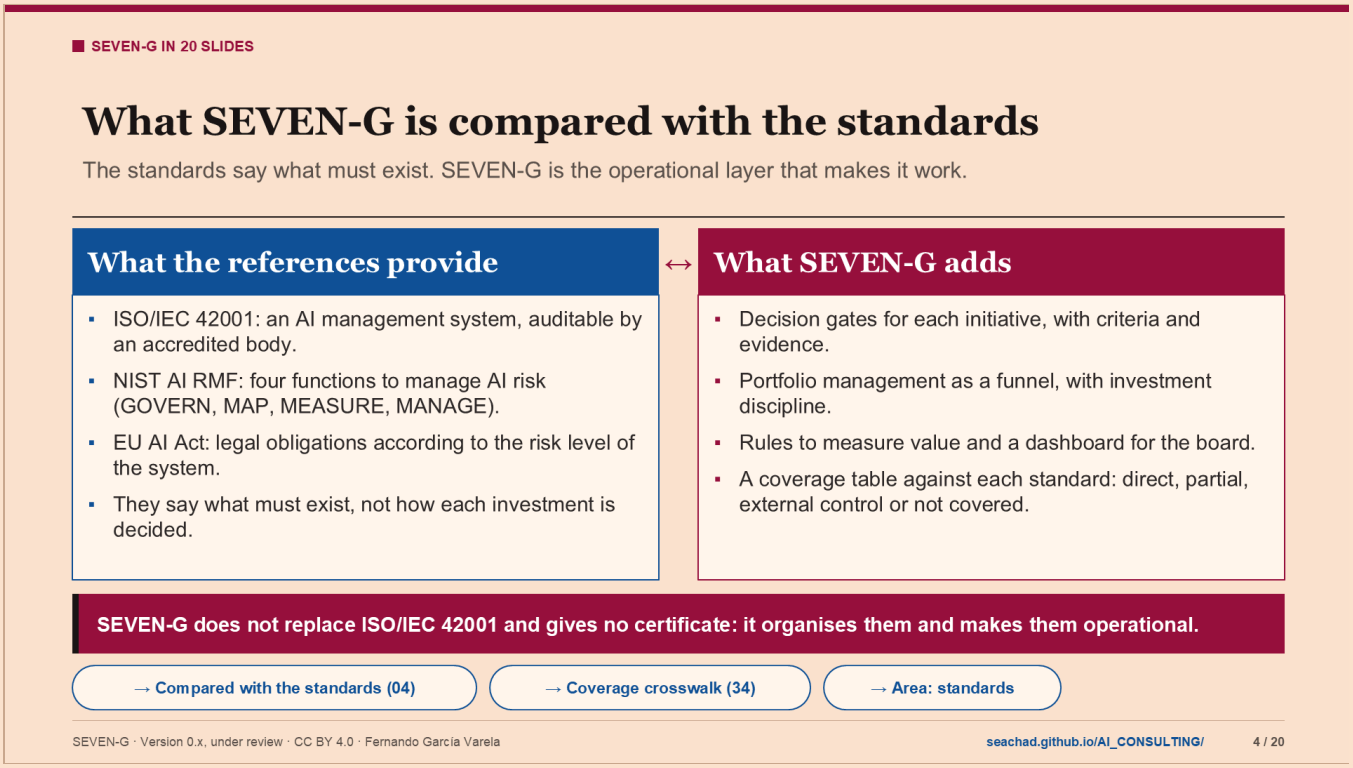

Classroom question: if you could ask your management committee only one of these six questions, which one would you ask and why?

Notes

A frequent question in the classroom is whether SEVEN-G competes with the standards. It does not compete: it organises them.

- ISO/IEC 42001 defines an AI management system. An accredited body can audit it and issue a certificate.
- The NIST AI RMF organises AI risk management into four functions: GOVERN, MAP, MEASURE and MANAGE.
- The EU AI Act sets legal obligations according to the risk level of the system.
- Other related standards are ISO/IEC 38507 (governance of AI by the governing body), ISO/IEC 23894 (risk management) and ISO/IEC 42005 (impact assessment).

What these references do not say is how to decide, initiative by initiative, whether an AI investment goes ahead, is corrected or is stopped, or how to prove its value to the board. That is the layer that SEVEN-G adds: decision gates, portfolio, value measurement and the board dashboard.

Document 34 has a versioned coverage crosswalk: for each clause or article it says whether SEVEN-G covers it directly or partially, whether it requires an external control or whether it does not cover it. The gaps are stated, not hidden.

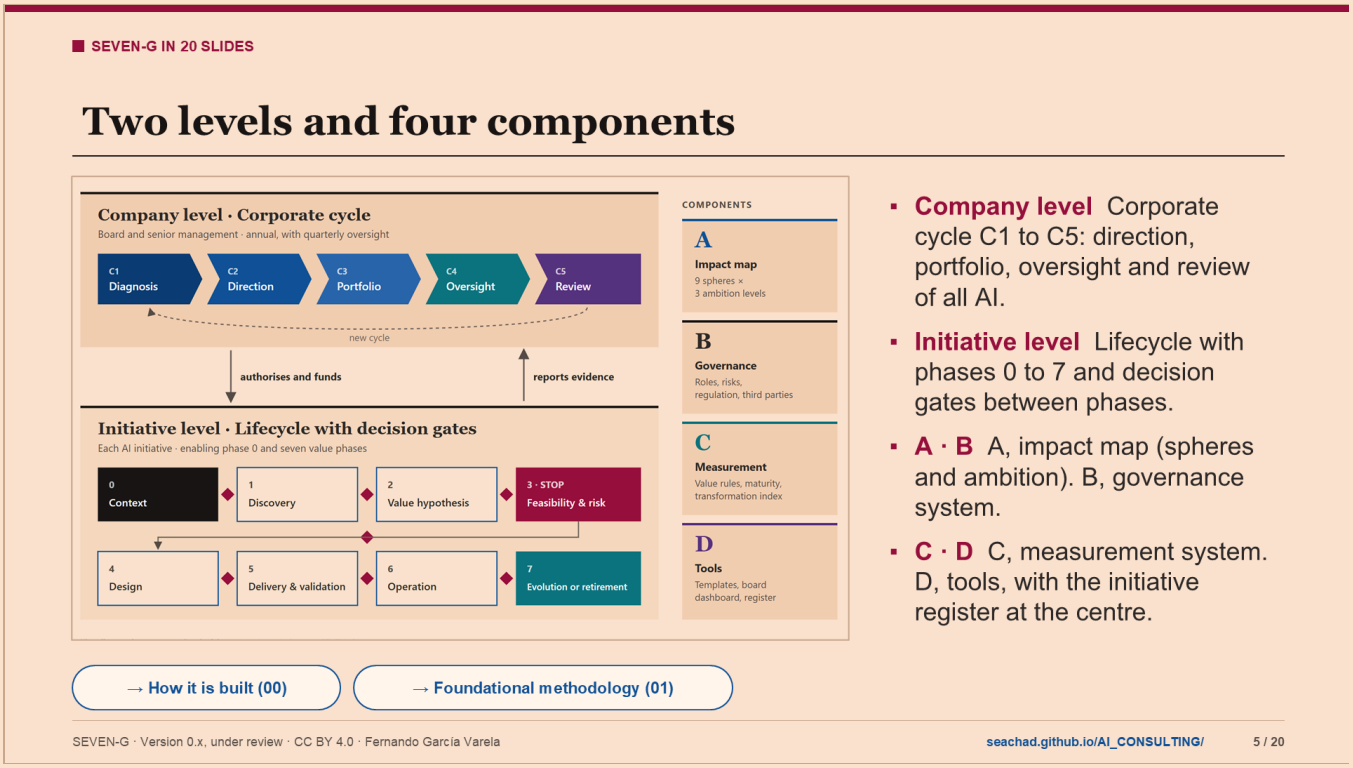

Why it matters: a company that already works with ISO/IEC 42001 does not have to choose. It can use SEVEN-G as its operating model and feed its evidence into the management system.

What SEVEN-G is not: it does not replace a standard, it gives no certificate and it is not legal advice.

Classroom question: what risk does a company run if it holds an ISO/IEC 42001 certificate but does not know what value each AI initiative gives it?

Notes

SEVEN-G works at two levels that feed each other.

- Company level: the corporate cycle C1 to C5. It is the annual cycle in which management and the board diagnose, set the direction, manage the portfolio, oversee and review. It deals with all of the company's AI at once.
- Initiative level: the lifecycle of each initiative, with phases 0 to 7 and a decision gate at the end of each phase. It deals with one specific use case.

And it has four components:

- A. Impact map: nine spheres where AI creates or enables value, and three ambition levels.
- B. Governance system: bodies, roles, segregation of duties and gates.
- C. Measurement system: value rules, full cost, maturity and the transformation index.
- D. Tools: the initiative register (T01) is the source of truth; the calculators, the diagnosis and the board dashboard read from it.

Why it matters: the company level without the initiative level is a strategy without execution. The initiative level without the company level is a sum of projects without direction. The board's decision in C2 (ambition and risk appetite) sets the criteria with which each gate is decided.

Example: in C2 the board decides that it wants to transform the customer sphere. From that moment, an initiative in that sphere with the Transform ambition needs board approval at G2 and at G7.

Classroom question: which level is usually missing more in companies: the corporate level or the initiative level?

SEVEN-G IN 20 SLIDES

The corporate cycle: C1 to C5

The annual cycle with which management and the board govern all of the company's AI.

Stage	What it answers	Decided or delivered
C1 Diagnosis	Where are we?	AI system inventory and maturity diagnosis.
C2 Direction	Where do we want to go?	AI thesis, ambition per sphere, risk appetite and framework budget. The board approves it.
C3 Portfolio	What do we do first?	Prioritisation, balance of ambition and risk and staged budget.
C4 Oversight	How is it going?	Quarterly pack and board dashboard.
C5 Review	What do we learn?	Annual review, recalibration of thresholds and declaration of application.

→ Corporate cycle (01 §5) → The C2 decision (13)

SEVEN-G · Version 0.x, under review · CC BY 4.0 · Fernando García Varela seachad.github.io/AI_CONSULTING/ 6 / 20

Notes

The corporate cycle is the part of SEVEN-G that belongs to management and the board.

- C1 Diagnosis: you learn what AI there is (inventory, including the AI that comes inside purchased products) and what maturity the company has, with the T15 diagnosis.
- C2 Direction: the board approves the decision that guides everything else. It has twelve components, among them the AI thesis, the ambition per sphere, the risk appetite, the investment thresholds, the horizon and discount rate and the framework budget.
- C3 Portfolio: the AI office and committee prioritise initiatives and allocate the budget by stages, not all at once.
- C4 Oversight: each quarter the board receives a pack with the dashboard, risks, incidents and the decisions requested from it.
- C5 Review: once a year the lessons learned are reviewed, the thresholds are recalibrated and the company can declare that it applies SEVEN-G.

Why it matters: without C2 there is no common criterion. Each area decides with its own threshold and the board cannot compare. That is why, during implementation, if the board does not approve C2, no Transform initiatives are approved.

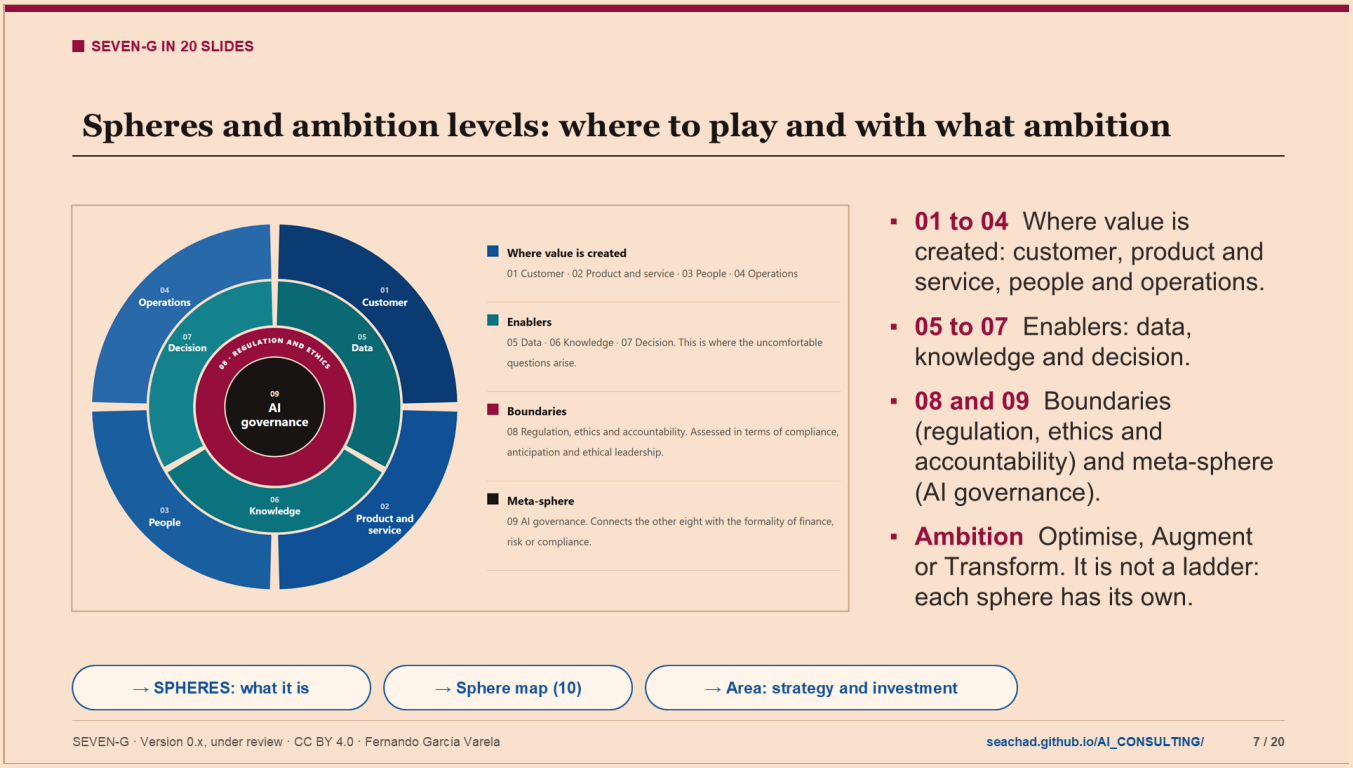

Example: in C2 the board sets an investment threshold. Above that threshold, an initiative moves to Enterprise intensity, with more evidence and more control.

Classroom question: which of the twelve components of C2 seems hardest to agree on in a real board, and why?

Notes

Component A of SEVEN-G is the impact map. SPHERES is the methodology that explains it in more detail and answers three questions: where do we play?, with what ambition? and what do we ask?

The nine spheres fall into four types:

- Where value is created (01 to 04): customer, product and service, people and operations.
- Enablers (05 to 07): data, knowledge and decision. They do not give value on their own, but without them the others do not scale.
- Boundaries (08): regulation, ethics and accountability.
- Meta-sphere (09): AI governance.

The three ambition levels are Optimise (do the same with less), Augment (do more or better with the same people) and Transform (change the process, the offer or the business model). They are not a ladder: a company can want to Optimise operations and Transform the customer relationship at the same time.

Why it matters: the ambition changes the gate criteria. An Optimise initiative must show a non-negative NPV at the feasibility gate; a Transform initiative does not need to at that moment, but it needs board approval at G2 and at G7.

Example: an assistant that summarises case files is Optimise in operations. A new service that exists only thanks to AI is Transform in product and service.

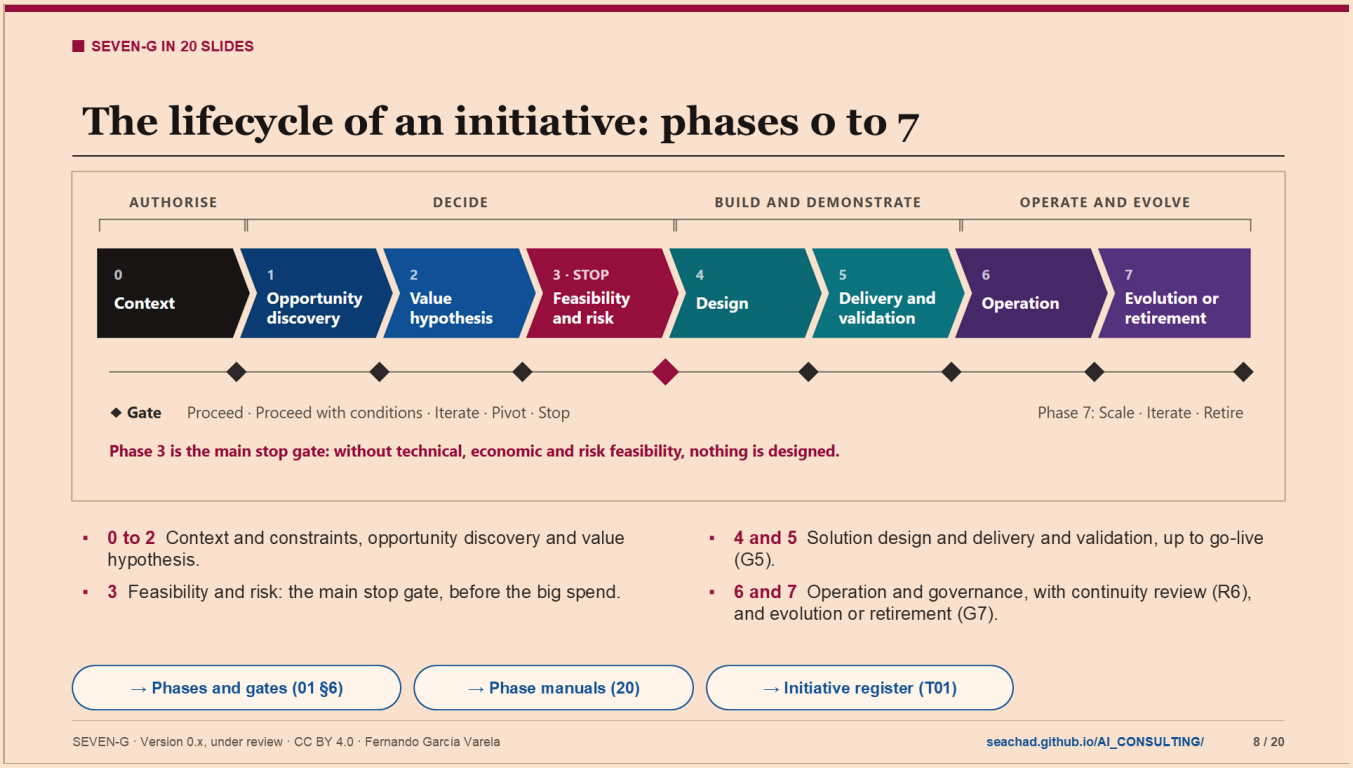

Classroom question: choose a well-known company. In which sphere would you place its main AI bet, and with what ambition?

Notes

Each AI initiative goes through eight phases. At the end of each one there is a decision gate.

- Phase 0, context and constraints (G0, authorisation): what is to be done, who sponsors it and what limits apply.
- Phase 1, opportunity discovery (G1, opportunity).
- Phase 2, value hypothesis (G2, hypothesis): a falsifiable hypothesis, with a baseline and stop criteria.
- Phase 3, feasibility and risk (G3, feasibility): regulatory classification, risks, full costs and real data. It is the main stop gate.
- Phase 4, solution design (G4, design).
- Phase 5, delivery and validation (G5, go-live), with a multi-level sign-off.
- Phase 6, operation and governance, with the periodic continuity review (R6).
- Phase 7, evolution or retirement (G7, scale or retire).

No phase or gate is skipped. What changes with the intensity (Express, Lite or Enterprise) is which criteria are assessed and which sessions are grouped.

Each phase has its manual (document 20) with objective, activities, evidence templates and frequent errors. Everything is kept in the initiative register (T01).

Why it matters: the cycle turns an idea into a series of small, reversible decisions. Money is committed by stages and each stage requires evidence.

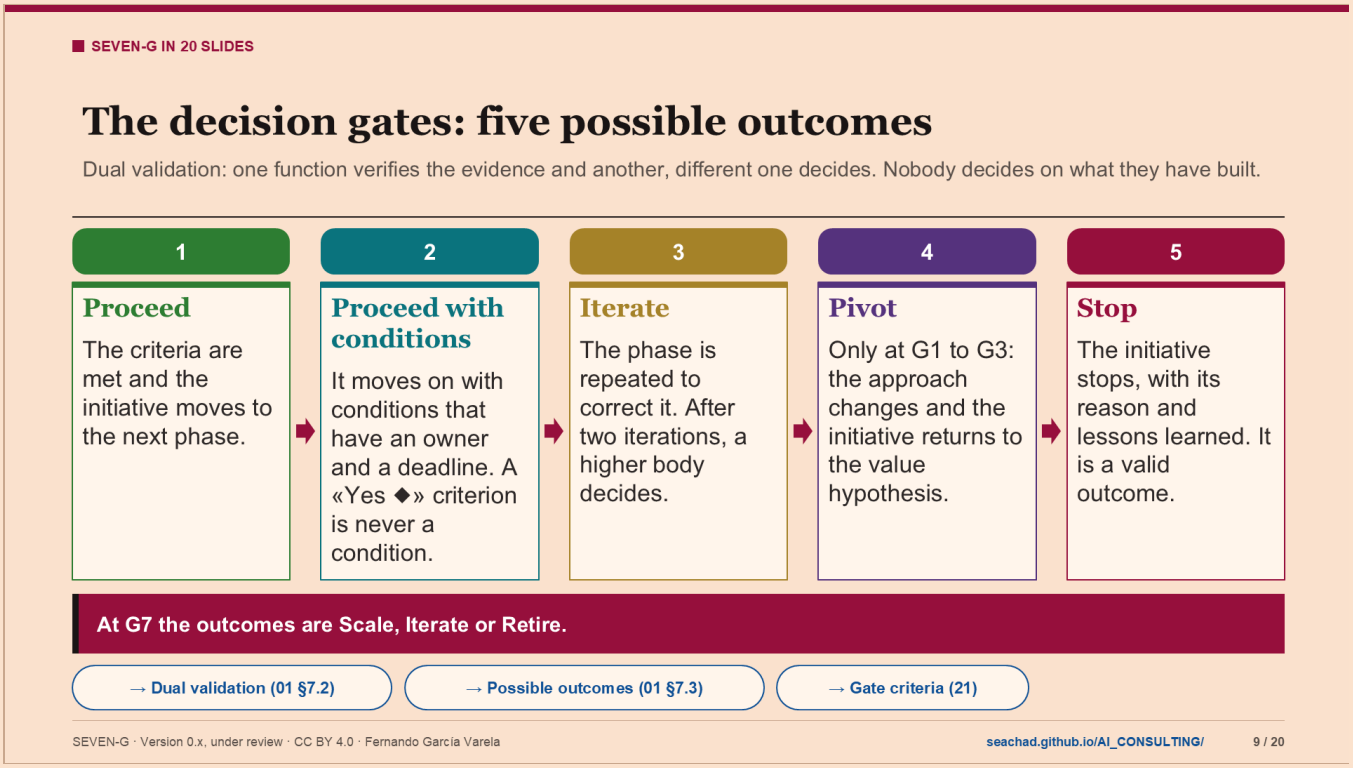

Example (fictitious): a demand forecasting model reaches phase 3. With real data, its accuracy does not improve on the current method. Gate G3 stops it before it is built.

Classroom question: why do you think operation (phase 6) is part of the cycle and not a step after the project?

Notes

A decision gate is a short meeting, or a written decision, in which the evidence for the phase is checked and a decision is taken on what happens to the initiative.

Dual validation: one function verifies that the evidence exists and meets the criteria (the AI office or the AI auditor, depending on the intensity) and another, different function decides (the sponsor, the committee or the board, depending on the gate and the ambition). Whoever builds the initiative neither verifies nor decides on it.

The criteria for each gate are in document 21. Some criteria are mandatory and some are marked «Yes ◆»: these can never be left as a pending condition, because they are the ones that protect the company.

Iterate is easy to explain: in phase 2 the value hypothesis gives an insufficient saving, but one that can be corrected. The gate asks for the phase to be redone. If after two iterations the problem remains, the decision goes up to a higher body, because the problem is probably fundamental.

Pivot is only allowed at gates G1, G2 and G3: the approach changes and the initiative returns to phase 2. At G7, at the end of the cycle, the outcomes are Scale, Iterate or Retire.

Why it matters: the separation between who verifies and who decides prevents an initiative from moving forward only because its promoter is in a hurry.

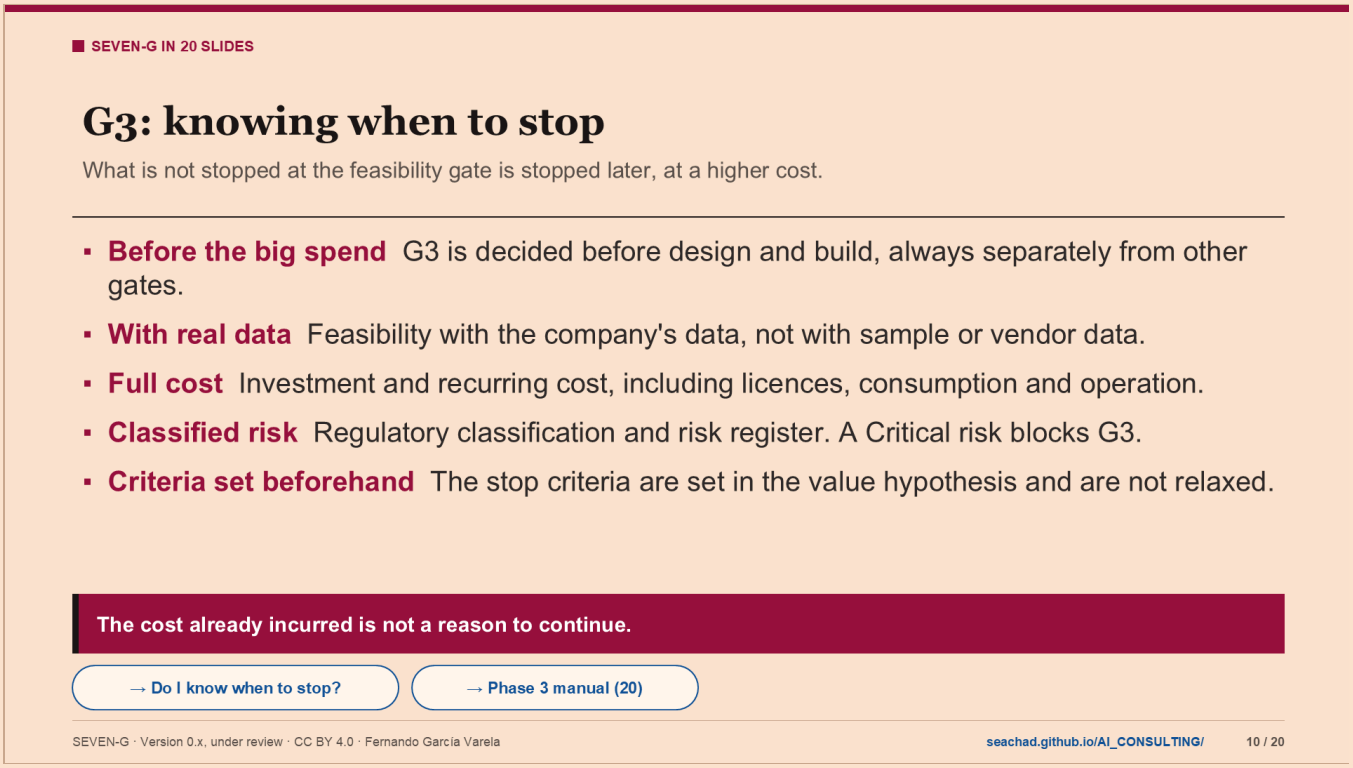

Frequent error: approving with conditions what should be Iterate, and not checking later whether the conditions were met. An expired condition turns the outcome into Iterate.

Classroom question: what incentives does a sponsor have not to stop their own initiative? How does dual validation neutralise them?

- **Gate criteria (21)** https://seachad.github.io/AI_CONSULTING/SEVEN-G/html/en/21_SEVEN-G_Criterios_de_gate_y_auditoria.html

Notes

Phase 3, feasibility and risk, ends at gate G3. It is the framework's main stop gate: what is not stopped here is stopped later, at a higher cost.

At G3 you check that the initiative works with the company's real data, that its full cost (investment and recurring cost) has been calculated, that it has a regulatory classification and a risk register, and that the value hypothesis still holds. For Optimise initiatives, in addition, the NPV must be zero or positive.

G3 is always decided separately. With Express intensity it can be resolved in writing, but it is not grouped with other gates.

Frequent errors in phase 3, according to its manual:

- Testing with sample or vendor data.
- Classifying regulatory risk without legal criteria.
- Forgetting recurring costs.
- Accepting a risk at a body lower than the one it belongs to.
- Continuing because of the cost already incurred.
- Turning feasibility into hidden construction.

Why it matters: stopping at G3 is cheap and stopping in production is expensive. The funnel records each stop with its reason and the lessons learned: a timely stop is learning for the organisation, not a failure.

Example (fictitious): an agent that handles returns reaches G3. The risk register shows a Critical risk because it accesses payment data without intent-based access control. G3 does not approve until the risk goes down a level.

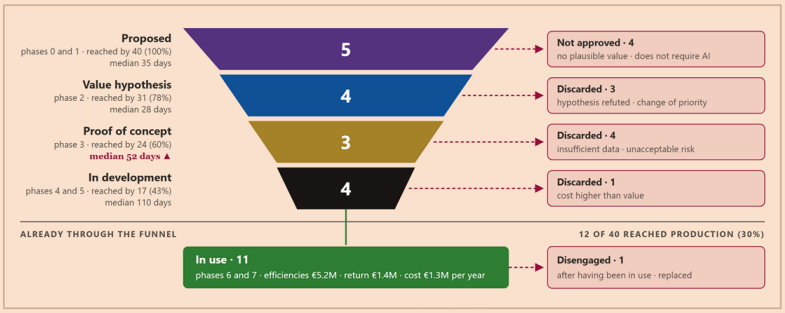

Classroom question: do you know a project that went ahead only because a lot had already been spent on it? What would a gate like G3 have changed?

SEVEN-G IN 20 SLIDES

The portfolio as a funnel

- **Stages** Proposed, value hypothesis, proof of concept and in development: the cases in progress.
- **Exits** Each case that does not pass a stage stays visible, with its reason and the lessons learned.
- **Result** At the end, the cases in use and those disengaged after being in use.
- **Times** Days in each stage and from entry to use: where the portfolio gets stuck.

→ The funnel on the entry page | → From the sales funnel (04) | → Initiative register (T01)

SEVEN-G · Version 0.x, under review · CC BY 4.0 · Fernando García Varela seachad.github.io/AI_CONSULTING/ 11 / 20

Notes

SEVEN-G manages the AI portfolio with the logic of a sales funnel: to reach production, an initiative must go through a mandatory set of states.

- Stages in progress: proposed (phases 0 and 1), value hypothesis (phase 2), proof of concept (phase 3) and in development (phases 4 and 5).
- Next to each stage, the cases that did not pass it, with their reason, who decided and what was learned.
- At the end, outside the funnel, two groups: the cases in use (phases 6 and 7) and the disengaged cases, which were in use and were retired.

From the sales funnel SEVEN-G takes the stages, the conversion between them and time control. But it departs at one key point: in sales, a high conversion is good; in an AI portfolio, a very high conversion can mean that the gates are soft and that nothing is stopped.

Why it matters: the funnel answers the question «am I making progress?» with facts: how many initiatives come in, how many reach use, where they get stuck and how long they take.

Example (fictitious data from the T01 register): the demonstration company has cases at every stage, some stopped at G3 because of risk or insufficient value and one case disengaged after its continuity review.

Try it: open the initiative register (T01), go to the funnel view and click a stage to filter its cases.

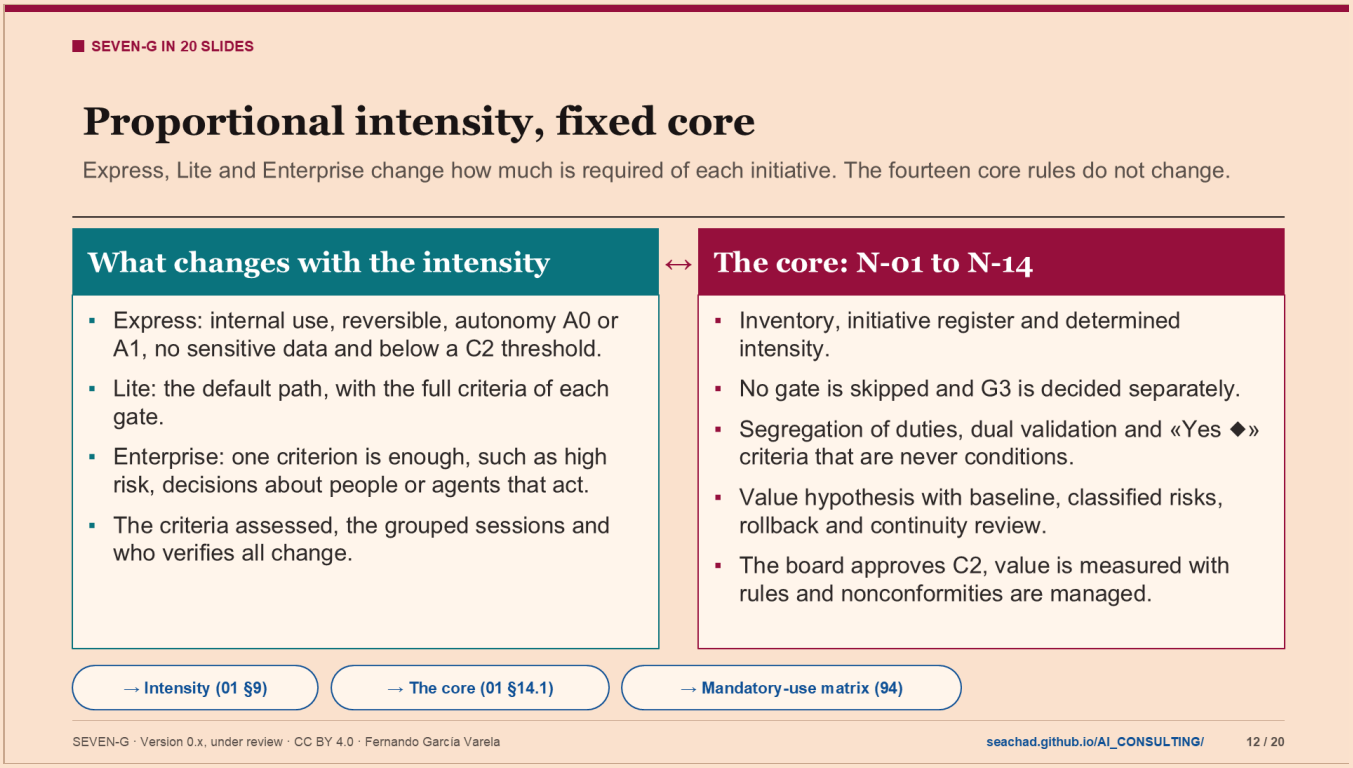

Classroom question: if an AI portfolio converts almost everything that comes in into production, is that good news? What would you ask?

- **Initiative register (T01)** https://seachad.github.io/AI_CONSULTING/SEVEN-G/herramientas/T01_registro_iniciativas/registro.html

Notes

SEVEN-G does not require the same of an internal assistant as of an agent that moves money. Proportionality is resolved with the intensity of each initiative.

- Express: for small, safe initiatives. No Enterprise criterion, internal use, reversible in days, autonomy A0 or A1, no sensitive data, investment and annual cost below the Express threshold of C2, and an already approved supplier if there is one. Eligibility is confirmed by the risk function, never by the sponsor alone. The gates are recorded in three decisions and G3 stays separate. If a trigger appears, the initiative leaves Express automatically.
- Lite: the default path.
- Enterprise: one criterion out of eight is enough, for example high regulatory risk, decisions about people, direct exposure to customers, agents that act with autonomy A2 or A3 on third parties or money, protected data, a critical function, the Transform ambition or investment above the C2 threshold.

The core is fourteen rules (N-01 to N-14) that are the same for every company, intensity and scope. The declaration that a company applies SEVEN-G is made against the core and cites its version.

Proportionality principle: no evidence is requested twice and no initiative bears a disproportionate governance cost, but the core is never lowered.

Why it matters: a framework that asks the same of everything ends up ignored. A framework without minimums stops protecting.

Example (fictitious): an internal contract clause review tool, with no sensitive data and autonomy A0, can go through Express; the same model, if it decides about customers, moves to Enterprise.

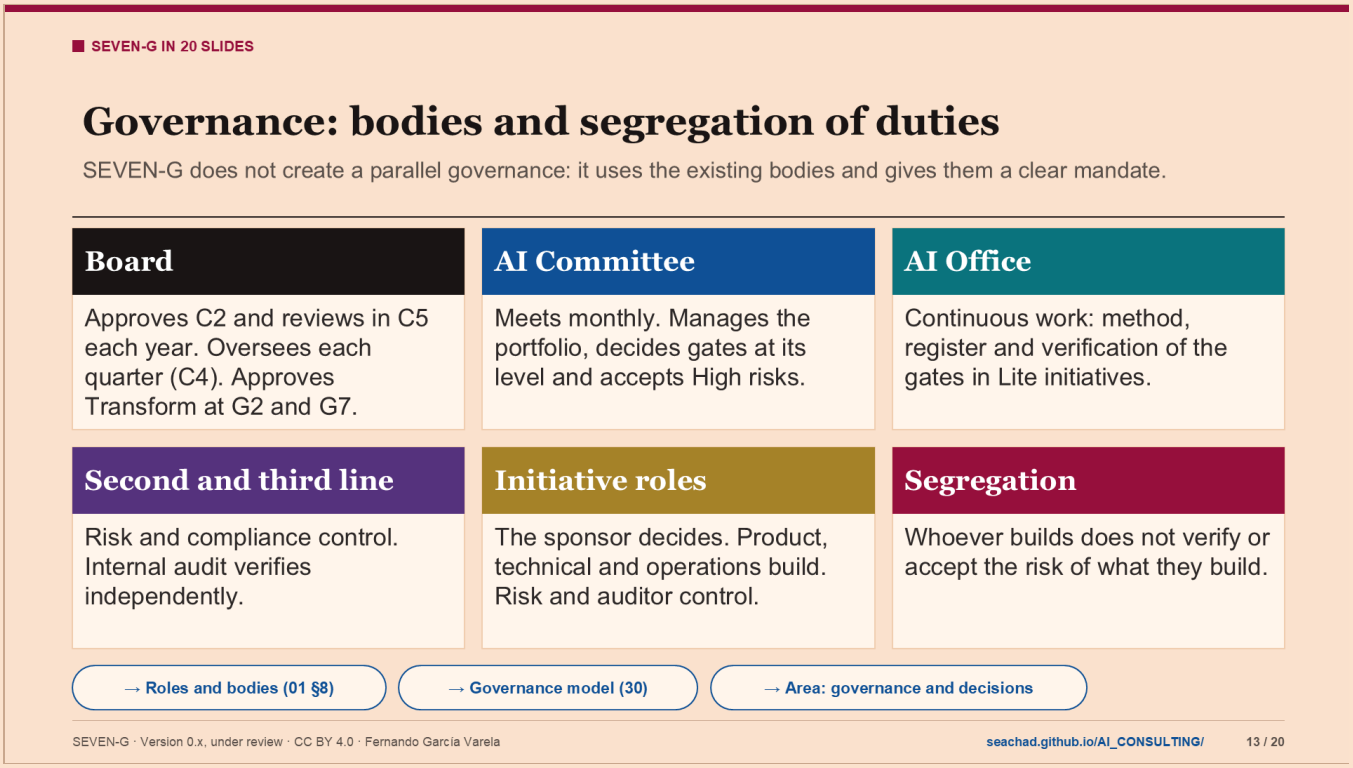

Classroom question: which core rule seems hardest to meet in a small company?

Notes

SEVEN-G governance relies on the bodies the company already has. It does not create a parallel governance.

- Board: approves the C2 decision and carries out the annual review in C5. It oversees each quarter with the C4 pack. It approves Transform initiatives at G2 and their scaling at G7.
- AI Committee: meets monthly. It manages the portfolio, decides the gates that belong to it and accepts High-level risks.
- AI Office: works continuously. It maintains the method and the register and verifies the gate criteria for Lite-intensity initiatives; for Enterprise initiatives the AI auditor verifies them.
- Second line (risk and compliance) and third line (internal audit), following the three lines model.

Six roles in each initiative: the sponsor decides; the product, technical and operations owners build; the risk owner and the AI auditor control.

Why it matters: segregation of duties is core rule N-06. If whoever builds also verifies and accepts their own risk, control disappears even if there are documents.

In a small organisation, three different people are enough to cover the minimum functions without incompatibilities.

Frequent error: placing AI governance inside the area that builds AI. Document 54 considers this the only unacceptable location.

Classroom question: in a company of one hundred people, who could be the AI risk owner without a conflict of interest?

SEVEN-G IN 20 SLIDES

Risk: 5 × 5 matrix and who accepts each level

Probability by impact, assessed before and after the controls. The level decides who can accept it.

Level	P × I score	Who accepts it	What it requires
Low	1 to 4	Product owner	Follow-up in the risk register.
Medium	5 to 9	Sponsor	Defined response: avoid, mitigate, transfer or accept.
High	10 to 15	AI Committee	Contingency plan and effective controls.
Critical	16 to 25	Not accepted; only the board, as an exception	Blocks G3 and G5 until it goes down a level.

Regulatory classification first: the EU AI Act decides which legal obligations apply.

→ Acceptance and escalation (33) → Template P12: risk matrix → Area: risk and regulation

Notes

The risk methodology (document 33) uses a five-by-five probability by impact matrix. The score goes from 1 to 25 and gives four levels: Low (1 to 4), Medium (5 to 9), High (10 to 15) and Critical (16 to 25).

Each risk is assessed three times: inherent (without controls), target residual (with the planned controls) and verified residual (with tested controls). The impact is looked at on five axes. There is an extreme impact rule: a maximum impact requires attention even if the probability is low.

The possible responses are avoid, mitigate, transfer or accept. And the level decides who can accept the risk: a High risk is not accepted by the sponsor, it is accepted by the committee. A Critical risk is not accepted; only the board can do so as an exception, and in the meantime it blocks G3 and G5. High and Critical risks need a contingency plan.

Before the assessment, the initiative is classified according to regulation: the EU AI Act sets different obligations according to the risk level of the system (prohibited practices, high risk, transparency). Document 34 links each obligation with its phase and its evidence.

Why it matters: without a common scale, each area measures risk in its own way and the board cannot compare or know what risk the company takes.

Example (fictitious): a candidate selection model decides about people. It is high-risk under the AI Act, moves to Enterprise intensity and its bias risks are assessed with the scale of document 33.

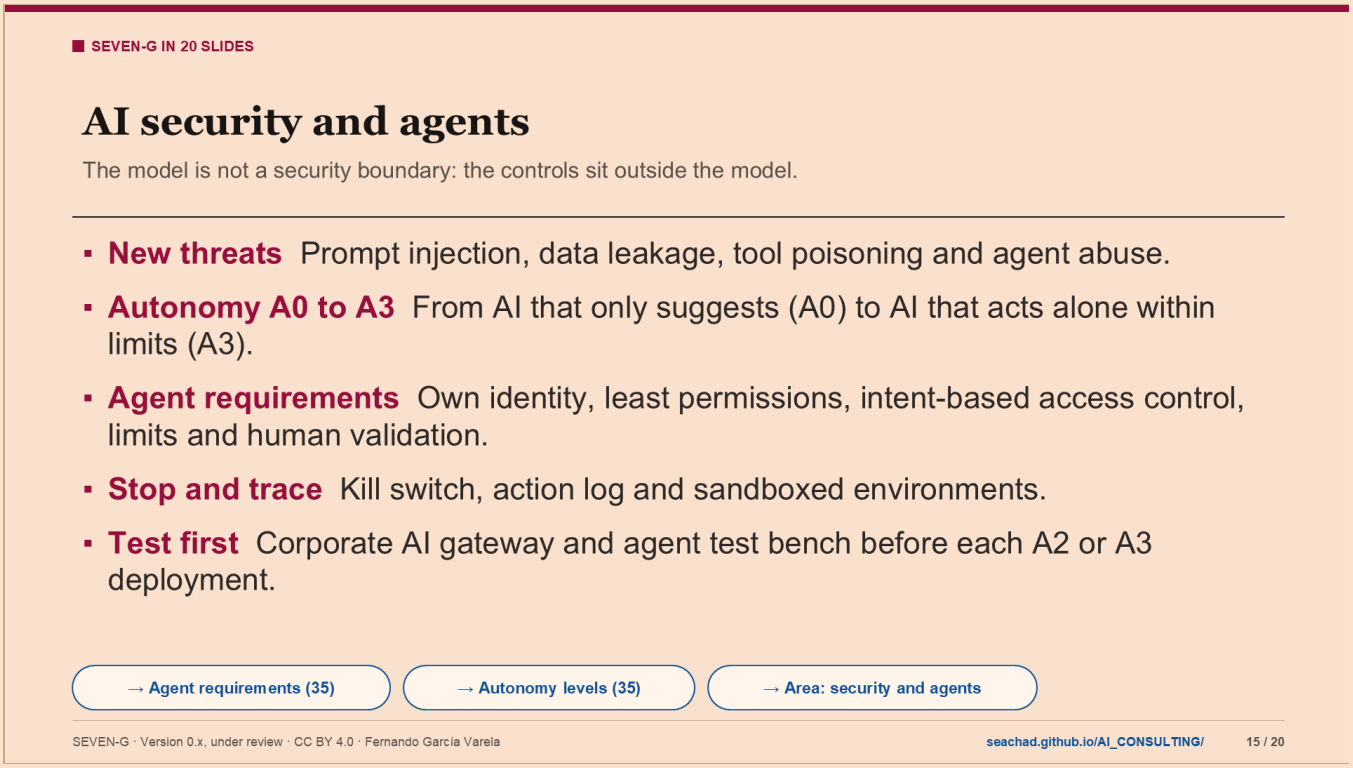

Try it: in the T01 register, the risk view generates an Excel file with the matrix and proposed plans for an example case.

Classroom question: why do you think the framework does not let the sponsor accept a High risk?

Notes

Generative AI and agents bring threats that classic security does not cover alone. Document 35 starts from a principle: the model is not a security boundary. A model can be deceived with instructions hidden in a document or a web page, so the controls must sit outside it.

Main threats: prompt injection, data leakage, tool and connector poisoning, and abuse of an agent's actions. The references are the OWASP lists for language model applications and for agentic applications.

Autonomy levels: A0 (AI suggests), A1 (it acts with human validation of each action), A2 and A3 (it acts alone within limits, with more or less oversight). An A2 or A3 agent with an effect on third parties, money, personal data or production systems moves to Enterprise intensity.

Nine requirements for an agent: own identity, least permissions, managed credentials, intent-based access control, action limits, human validation of sensitive actions, kill switch, action log and sandboxed environments. If the agent serves customers, it must be able to hand over to a person immediately.

Why it matters: an agent that acts is a digital employee with access to systems. Without these controls, an error or an attack becomes a real action.

Example (fictitious): an agent that pays supplier invoices reads an invoice with a hidden instruction to change the bank account. Intent-based access control and human validation of account changes prevent the payment.

Classroom question: what autonomy level would you give an agent that answers customers about the status of their orders? And one that grants discounts?

SEVEN-G IN 20 SLIDES

Measuring value: amount status, full cost and NPV

Every amount has a formula, a status and an owner. The cost is always full.

Magnitude	Who backs it	How it counts
Validated value	Management control or audit	It is the part of the net figure the board can believe.
Declared value	The area that owns the benefit	Shown apart from validated value, with its proportion.
Estimated value	The initiative team	It is a forecast: it is not validated or added up as realised.
Released capacity	The area that releases it	Not counted until it is materialised or reassigned.
Cost	Finance	Always full: investment and recurring cost, with no discount by status.

Single economic criterion: NPV ≥ 0 with the C2 horizon and rate. ROI and payback are for information.

→ Amount statuses (40) | → Value calculator (T11) | → Are my use cases profitable?

SEVEN-G · Version 0.x, under review · CC BY 4.0 · Fernando García Varela seachad.github.io/AI_CONSULTING/ 16 / 20

Notes

Document 40 sets ten value measurement rules. The most important ones for the classroom:

- Every amount has a formula and is incremental against a baseline.
- Every amount has a status: validated (confirmed by management control or audit), declared (stated by the area that owns the benefit) or estimated (a forecast). Expected value is not validated: only realised value is validated.
- Released capacity (hours that AI saves) is not counted until it materialises as a real saving or is reassigned to another activity.
- «No data» is not zero.
- Efficiencies, return and recurring cost are presented separately.

The cost has no discount by status: it is always counted in full, with investment and recurring cost (licences, consumption, operation, people). Document 42 details its categories.

Single economic criterion: NPV greater than or equal to zero, with the horizon (H) and discount rate (r) that the board sets in C2. ROI and the payback period are reported, but they do not decide. Transform initiatives do not require a non-negative NPV at G3; they are governed by stages.

Illustrative example from document 40: an investment of 180,000 €, with an H of 3 years and an r of 8 %, gives an NPV of 46,604.18 €. The figure is fictitious and only shows the calculation.

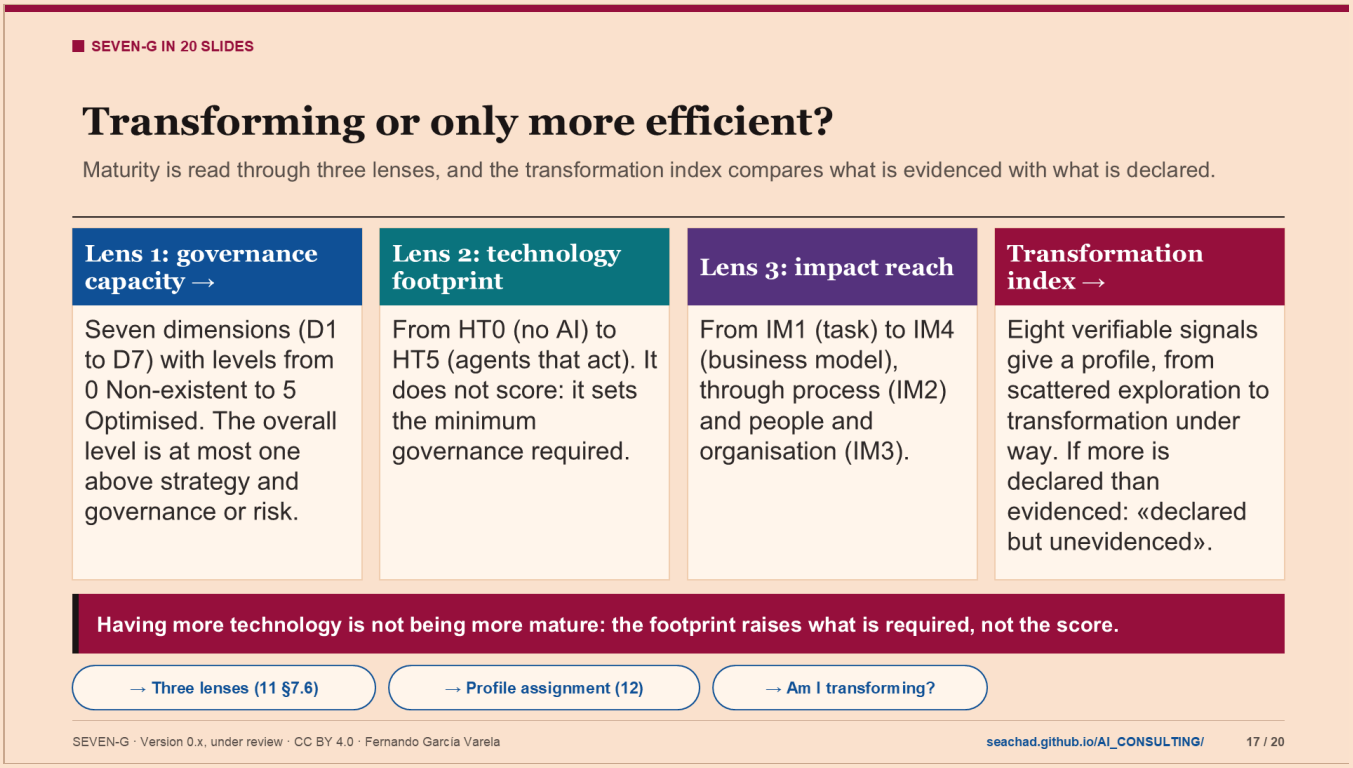

Why it matters: the most frequent error is presenting estimated savings as if they were results. Document 40 lists thirteen errors that inflate value.

Classroom question: a pilot saves 20 % of a team's time, but nobody changes tasks and the cost does not go down. How much value should be counted?

Notes

SEVEN-G answers the question of whether the company is transforming or only becoming more efficient with two instruments.

Maturity model (document 11, tool T15), read through three lenses that are presented together:

- Governance capacity: seven dimensions (strategy and governance, value and portfolio, data and knowledge, technology and operations, people and adoption, risk and compliance, measurement and evidence), each from 0 to 5. The overall level is capped at the level of D1 or D6 plus one.
- Technology footprint: from HT0 to HT5 (no AI, rules or RPA, third-party AI, own predictive models, generative AI in processes, agents that act). It is descriptive: it does not raise the score, but it sets the minimum governance required in each dimension.
- Impact reach: from IM1 to IM4 (task, process, people and organisation, business model).

There are three alerts: adoption ahead of governance, governance without use and transformation without people.

Transformation index (document 12, tool T14): eight verifiable signals assign a profile (scattered exploration, tactical efficiency, efficiency at scale or transformation under way). Then it is compared with what the company declares. If it declares transformation without evidence, the profile is «declared but unevidenced transformation».

Why it matters: adding technology to maturity would reward adopting ahead of governance. A company with well-governed predictive models is more mature than one with uncontrolled agents.

Example: the fictitious demonstration data in T14 give «declared but unevidenced transformation». Open it and see which signals would move the profile.

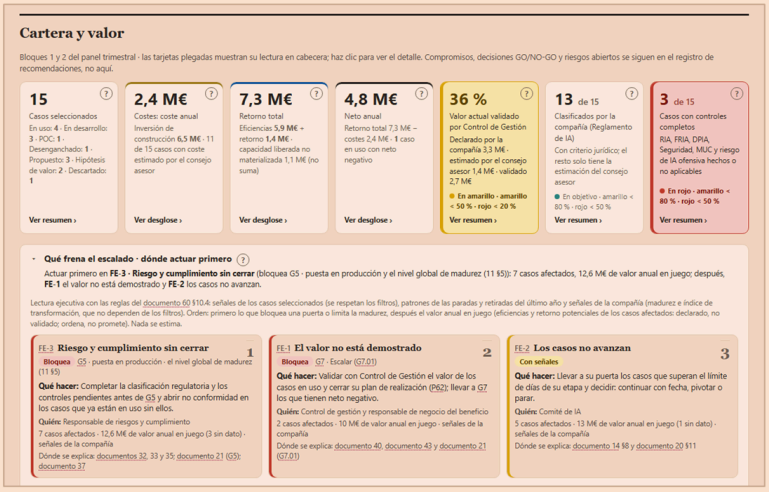

Classroom question: why would a company declare a transformation that it cannot evidence?

■ SEVEN-G IN 20 SLIDES

The board: dashboard, what holds back scaling and where the impact is

- **T17 dashboard** Generated from the T01 register: portfolio, value, funnel, risks and maturity in one view.
- **Barriers FE-1 to FE-6** What prevents scaling and where to act first: blockers first, then the value at stake.
- **Impact map** Spheres by ambition level, against the ambition the board approved in C2.
- **Fictitious data** Screenshot in Spanish of the example dashboard, with an invented company.

→ Board dashboard (T17) | → What holds back scaling (60) | → Area: board and management

SEVEN-G · Version 0.x, under review · CC BY 4.0 · Fernando García Varela seachad.github.io/AI_CONSULTING/ 18 / 20

Notes

The board dashboard (T17) is not an application where data is entered: it is a generator. It reads the initiative register (T01) and produces the full dashboard, the mobile version and the recommendations register. Each figure can be clicked to see the cases behind it, and each card has a «?» that explains what it shows and why it matters.

What holds back scaling: an executive reading with six scaling barriers.

- FE-1, value is not proven.
- FE-2, use cases do not move forward.
- FE-3, risk and compliance are not closed.
- FE-4, people do not adopt it.
- FE-5, data and technology are not ready.
- FE-6, direction and governance are missing.

They are ordered first by what blocks a gate and then by the annual value at stake, which is declared and not validated: it orders, it does not promise. The first three are «act first on».

Where the impact is: the heat map of spheres by ambition level (T16) shows where there are initiatives, how much is invested and how much validated value there is, and marks the gaps against the ambition the board approved in C2.

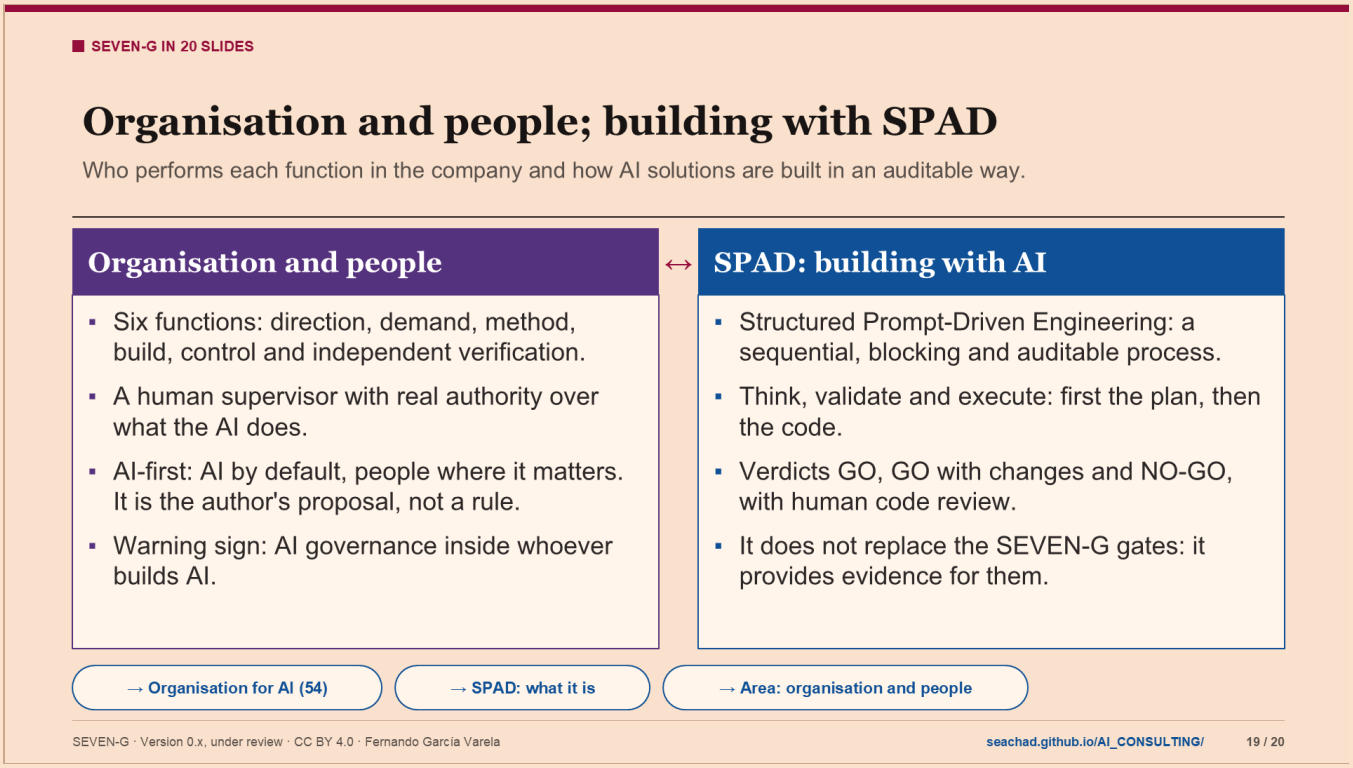

Why it matters: with many metrics, a dashboard informs but does not help to decide. These two readings answer «where to invest?» and «how to scale?».

Example: the dashboard data belong to a fictitious company. The screenshot is in Spanish.

Classroom question: if the dashboard shows FE-4 (people do not adopt it) as the first barrier, what decision should the board take and who carries it out?

Notes

Organisation. Document 54 places the framework in the real organisation chart. There are six functions someone must perform: direction, demand and sponsorship, coordination and method, build and operation, control and independent verification. Four patterns are seen in the market: technology leads, transformation leads, an AI office or a de facto federated model. None is right on its own; the only unacceptable location for AI governance is inside whoever builds AI.

People. Document 50 covers the effect of AI on work, the new roles (for example, the human supervisor with real authority), AI literacy by profile and the reassignment of released capacity.

AI-first company. Document 54 proposes a definition: each process is designed assuming that AI does the work or proposes the decision, and people set the objective, decide on the exceptions and answer for the result. It is the author's proposal, not a rule of the framework.

SPAD (Structured Prompt-Driven Engineering) is the support methodology for building solutions with AI. It separates the AI roles (planner, reviewer, builder) and requires a reviewed plan before the code, GO, GO with changes or NO-GO verdicts and human review. It claims no improvement figure. Its verdicts do not replace the SEVEN-G gates: its artefacts are evidence for them (document 53).

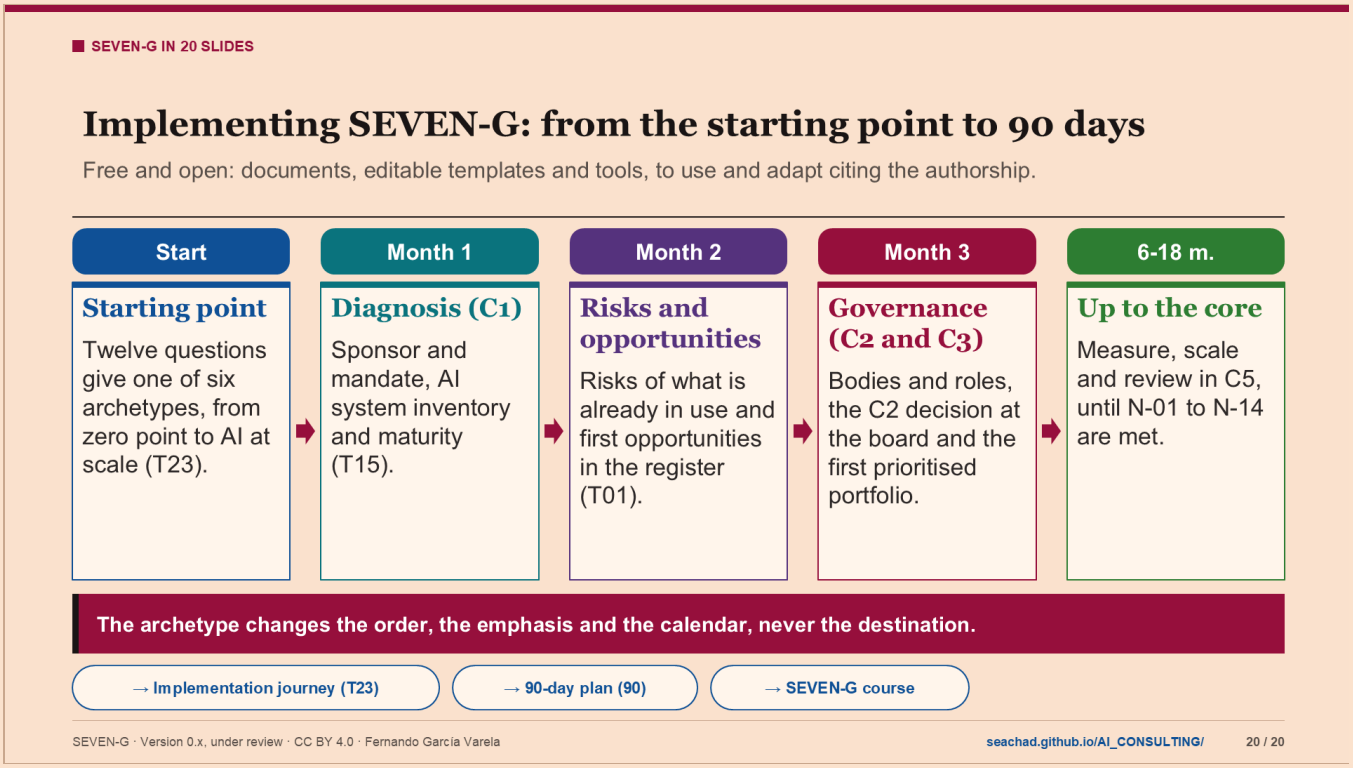

Why it matters: a good methodology fails if nobody has the role of applying it, or if code is generated without control.

Classroom question: in your organisation, who performs the independent verification of AI today? Does that function exist?

Notes

Not all companies start from the same point. Document 96 and tool T23 classify the starting point with twelve questions into six archetypes: zero point, third-party AI user, automator (rules or RPA), in-house AI in production, many pilots and at scale. Five modifiers adjust the journey, for example a regulated sector or previous governance that can be reused. The archetype changes the order, the emphasis and the calendar of 22 milestones, never the destination.

The 90-day plan (document 90):

- Month 1, diagnosis (C1): sponsor, mandate, inventory and maturity.
- Month 2, risks and opportunities: what is already in use is regularised and the first opportunities come in.
- Month 3, governance structure (C2 and C3): bodies, roles, board decision and first portfolio. If the board does not approve C2, no Transform initiatives are approved.

Then a 6 to 18 month roadmap leads to the core N-01 to N-14. In a small organisation, three different people are enough for the minimum roles.

Frequent errors: a general AI moratorium, putting everything in Enterprise, documenting after the fact and presenting the implementation as if it were a certificate.

Everything is free: documents, templates editable in Word, tools and a course, without registration. The content is under the CC BY 4.0 licence and the code under the MIT licence: it can be used, adapted and integrated into your own methodology, also for commercial purposes, citing the authorship of Fernando García Varela. Using the framework does not oblige anyone to hire anyone.

Classroom question: choose a well-known company. Which archetype would you assign to it and what would you do in its first month?
