

Notes

SEVEN-G (Seven-phase Enterprise Value & Governance) starts from one idea: AI is not one more technology or one more product. It is an enabler, an accelerator and a transformer of the company. That is why it is treated as a strategic asset, and its decisions do not belong to the technology area alone.

In most organisations, AI grows faster than the capacity to govern it. The symptoms repeat in any sector:

- The board receives an inventory of technical projects, not business decisions.
- There are many pilots and few use cases in production.
- Value is declared, but nobody validates it.
- Nobody has a formal criterion to stop a project.
- Doing the same thing at a lower cost is called “transformation”.

SEVEN-G holds that these problems are not technological: they are problems of governance and measurement. That is why it starts with the six questions that a board will end up asking. Each card links to a page of the site that explains how the framework answers it and where to see it.

Example. One team tries an assistant, another automates a report and a supplier gives away a proof of concept. In a few months there are a dozen initiatives. The board asks whether they produce anything and receives twelve different spreadsheets. With SEVEN-G, the answer comes from a single initiative register.

Why it matters. If AI is treated as a technical matter, the board cannot prioritise, cannot demand and cannot exercise its oversight responsibility.

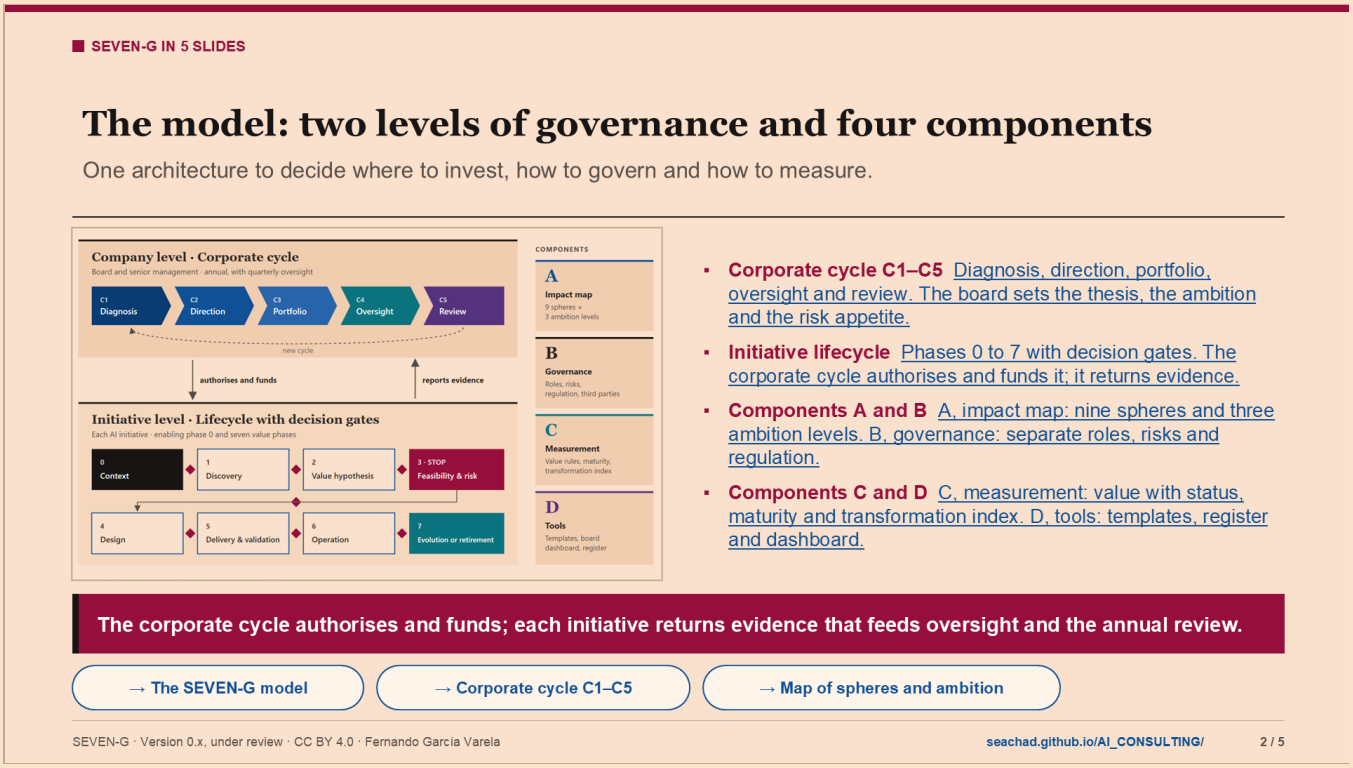

Question for the classroom: which of the six questions could your organisation answer today with evidence, and which could it not?

Notes

SEVEN-G is organised into two levels of governance: the company level and the level of each initiative.

The corporate cycle is the one used by the board and senior management. It runs every year, with quarterly oversight, in five stages:

- Diagnosis (C1): where are we. AI system inventory, maturity with evidence and current value.
- Direction (C2): where do we want to play. AI thesis, ambition per sphere and risk appetite. The board approves it.
- Portfolio (C3): what we fund and what we stop.
- Oversight (C4): whether what was decided is being delivered. Board dashboard, incidents and nonconformities.
- Review (C5): whether we have made progress and whether we are transforming.

The initiative lifecycle is the one the teams go through: eight phases (0 to 7) with decision gates. The two cycles are connected: the corporate cycle authorises and funds the initiatives, and each initiative reports evidence that feeds oversight and the annual review.

The four components are used at both levels:

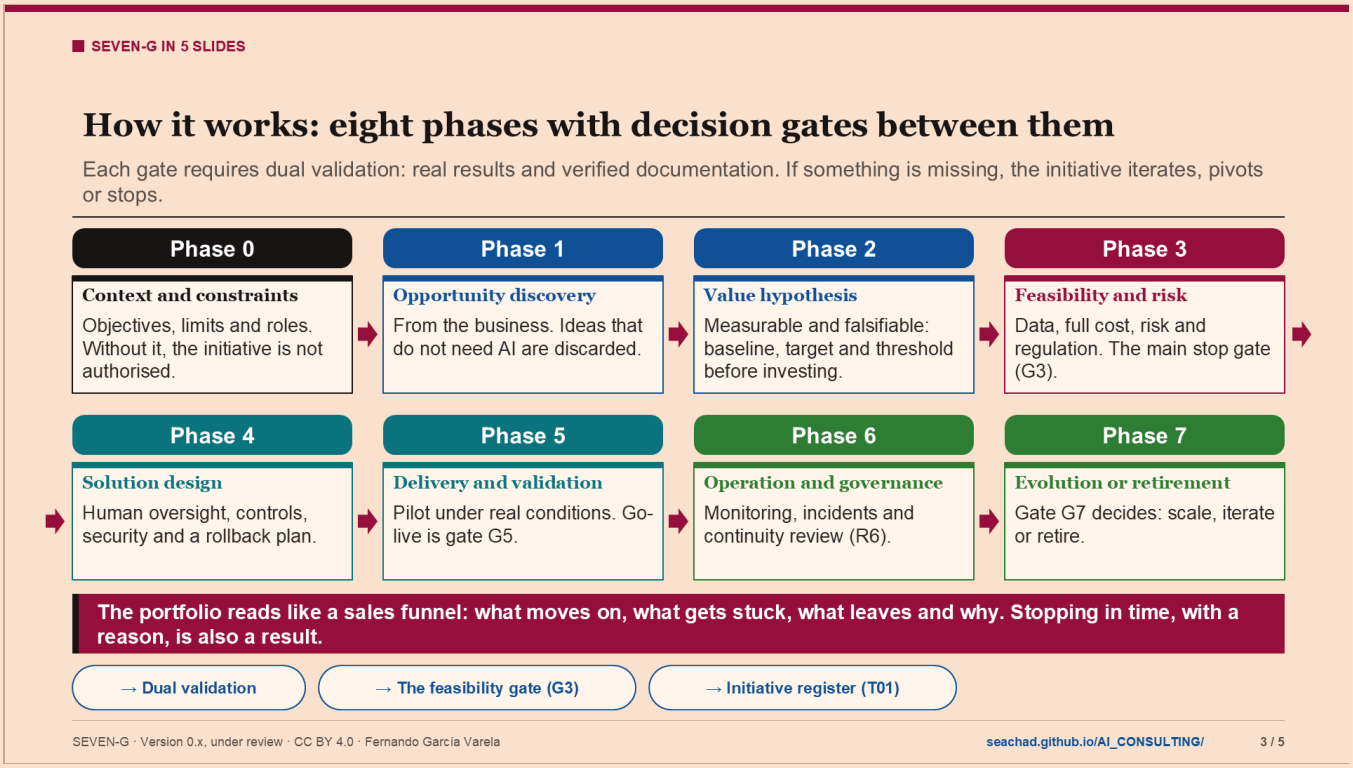

- A, impact map: nine spheres (customer, product and service, people, operations, data, knowledge, decision, regulation and governance) and three ambition levels: Optimise, Augment and Transform.
- B, governance system: roles, bodies, risks, regulation, third parties and nonconformities.
- C, measurement system: value rules, indicators, maturity and transformation index.
- D, tools: templates, checklists, initiative register and board dashboard.

Example. In C2, management decides that the customer sphere has a Transform ambition. From that moment, an initiative in that sphere competes with its peers and the board approves it, not only the business area.

Why it matters. Without a corporate cycle, AI remains isolated projects. The impact map makes it possible to talk about AI without talking about technology, and it forces a decision on where to create value and what will not be funded.

Notes

Each AI initiative goes through eight phases. Phase 0 is enabling: without it, the initiative is not authorised. The next seven take it from the opportunity to demonstrated value. The “G” in SEVEN-G says that governance is present in all of them.

At the end of each phase there is a decision gate. In phase 6 the gate is replaced by a periodic continuity review (R6). Each gate follows the same sequence: the team provides the evidence, a verifier checks that it is complete and valid, and the competent body decides. No one approves their own work.

Dual validation: a gate is passed only with tangible results and verified documentation at the same time. Results without documentation, or documentation without results, do not pass it.

Possible outcomes of a gate: proceed, proceed with conditions, iterate, pivot (go back to phase 2 with a new hypothesis) or stop. Iterating is allowed twice; the third time, the decision is escalated to someone with more authority.

The feasibility gate (G3) is the main stop gate. It comes before the heavy investment. It requires feasibility demonstrated with real data, full cost, regulatory classification and assessed risks. Practices prohibited by regulation never get past this phase.

The portfolio as a funnel. SEVEN-G reads the set of initiatives as a sales funnel. Registering an initiative is like logging an opportunity in a CRM. Stages: Proposed (phases 0 and 1), Value hypothesis (2), Proof of concept (3) and In development (4 and 5). Those In use (6 and 7) have already gone through it.

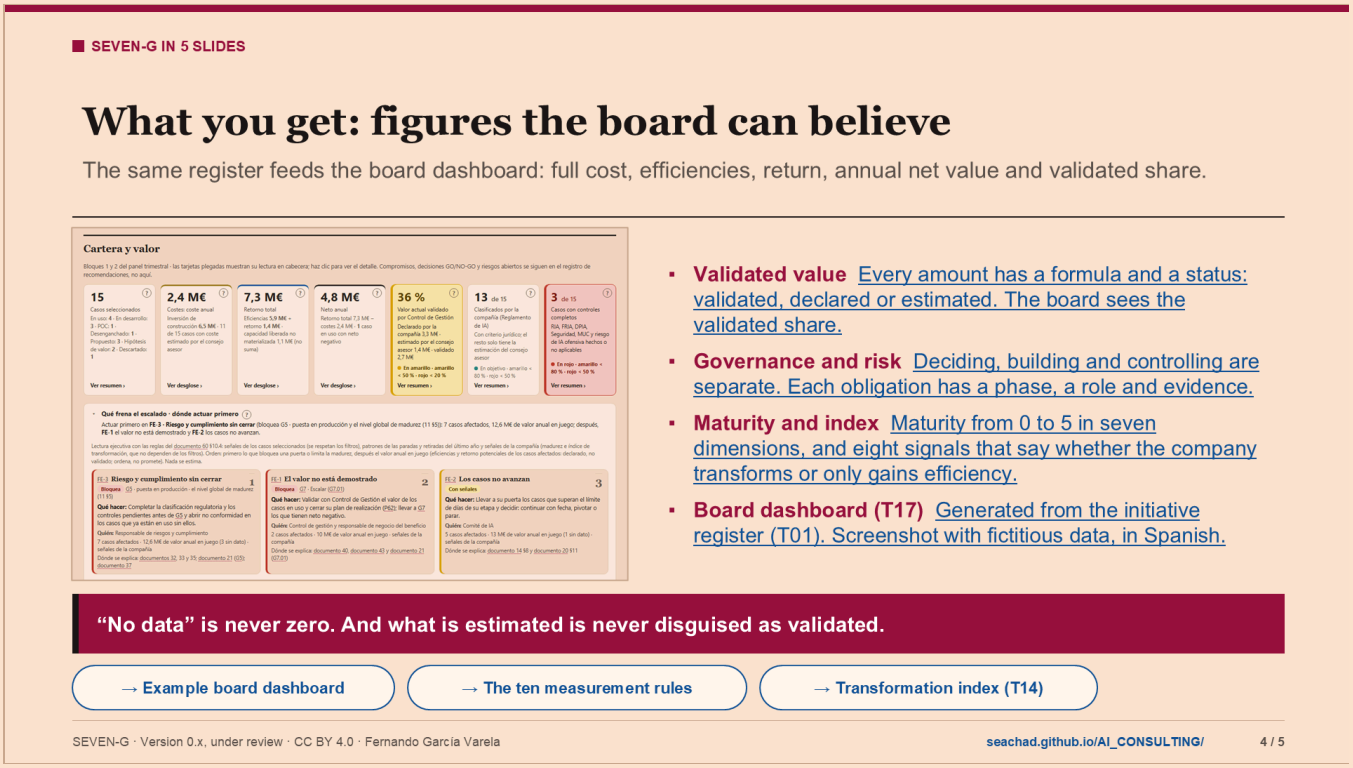

Example. In phase 2, the measured saving is below the target, but a specific adjustment could close the gap. The initiative does not move on with insufficient data: it iterates.

Why it matters. Gates prevent two expensive errors: going into production without evidence and keeping value-poor initiatives alive by inertia. Avoiding a bad investment also creates value.

Notes

SEVEN-G does not tell you which technology to buy. It gives you a single view of your AI: what you have, what it costs, what it delivers with evidence, which risks you take and who is accountable for each one.

Validated value. Every amount has a formula (units times unit value) and is incremental against a baseline. Every amount has a status: validated by management control or audit, declared by the business area or estimated. Released capacity is not counted as a saving until it is materialised or reassigned. Efficiencies, return and recurring cost are shown separately. "No data" is not zero.

Governance and risk. Whoever builds does not control, and no one approves themselves. Each regulatory obligation (EU AI Act, GDPR, DORA, NIS2, ISO/IEC 42001) is linked to a phase, a role and evidence. SEVEN-G does not certify compliance: each organisation checks it.

Maturity and transformation index. Maturity is measured from 0 to 5 in seven dimensions, with observable evidence. The transformation index reads eight signals from the portfolio, among them the value mix, the redesigned processes and the AI-enabled revenue. The profile a board most needs to detect is "transformation declared, not evidenced".

Board dashboard (T17). It is generated from the initiative register (T01), in a full and a mobile version. The screenshot uses a fictitious portfolio of 15 initiatives; the figures are illustrative. It includes the "what holds back scaling" reading, which says where to act first.

Example. A business area declares a saving from released hours. Until those hours become a real lower cost or an explicit reassignment, the dashboard shows them separately and they do not count in the net value.

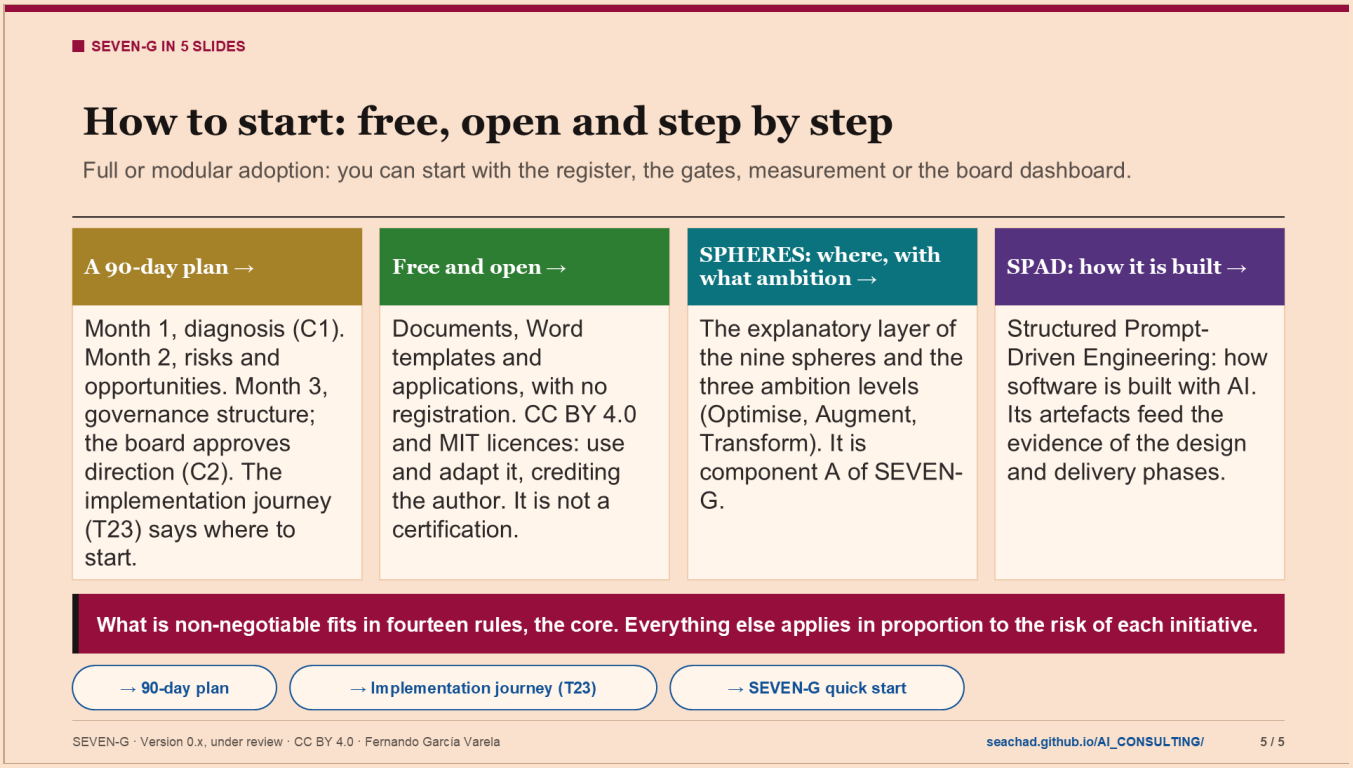

Why it matters. With figures that withstand an audit, the board moves from receiving reports to asking with data and deciding where to put or remove money.

Notes

Starting does not require implementing everything. Adoption can be full or modular: start only with the initiative register, the decision gates, value measurement or the board dashboard, and expand later.

90-day plan. The implementation guide concentrates the first three stages of the corporate cycle into three months:

- Month 1, diagnosis (C1): AI system inventory, maturity with evidence and transformation profile.
- Month 2, risks and opportunities per sphere, with owner, economic impact and timeframe, and the draft of the direction (C2).
- Month 3, governance structure: bodies, roles, gates, metrics and reporting cadence. The board approves the thesis, the ambition and the risk appetite (C2) and the committee approves the portfolio (C3).

The implementation journey (T23) says where to start, based on the AI and the governance the company already has.

Free and open. The whole site can be used, read and downloaded with no registration. The contents have a CC BY 4.0 licence and the code an MIT licence: they can be used, adapted and integrated into your own methodology, on the condition of crediting the author (Fernando García Varela) and indicating the changes. SEVEN-G is not a certification nor an alternative to ISO/IEC 42001: it is the operating layer that makes what the standards require work.

How it relies on the other frameworks. SPHERES is the explanatory layer of component A: the nine spheres and the three ambition levels, with examples and questions for the board; the operating rules are in SEVEN-G. SPAD (Structured Prompt-Driven Engineering) is an independent methodology to build software with AI. Its verdicts do not replace any SEVEN-G gate; its artefacts are inputs to the evidence.

Example. A medium-sized company with no AI team can apply the Lite scope with its executive committee, one part-time person and an external auditor.

Why it matters. The cost of putting things in order is not in understanding what to do, but in building the instruments. Starting from complete material lets you spend the effort on deciding.

Question for the classroom: with which component would your organisation start, and why?
